For boatanchor stuff......................
On your list of places to buy and sell, for those who are not already on it,
there is baswaplist@muchstuff.com.

baswaplist has existed about 12 years. In the beginning it was
baswaplist@foothill.net.
It exists only for buy, sell and swap.
It has always required prices for items offered for sale; unless it is
clearly not possible to come up with a market value.
This is a no BS list. No discussions, death notices. tornado warnings,
and
most despised, is an apology, particularly an apology for a message that
should not have been posted. The "Subject" of no message should begin
with
"Re:"
It is clearly my list. I have removed subscribers for what I may deem as
cause; but, I make no representations of keeping bad people off of the
list. I have never accepted payment for anyone being a subscriber, and
have
no plans to do so.
Any messages for administration of the list should go to
soundval@muchstuff.com or rippen@muchstuff.com.
I try not to overly butt into the dealings; however, for myself, I try
to
use PayPal as often as practical. That offers protection to both buyers
and
sellers.
What can be listed? All tube era gear, parts, paper items (books,
magazines, catalogs), Generally a posting should not be repeated other
than
once more in about a week. Postings of swap meets to come, may be posted
twice, but it may not list any unpriced items, unless it is really
impossible to find prices for an item.
.
To subscribe: Using your email address in your heading and the Subject:
"subscribe" (without quote marks)
send it to   baswaplist-request@muchstuff.com. No message necessary. No
human is going to read it.
To unsubscribe do the same except say "unsubscribe". See! No BS.

I was recently thinking about the SB102 that I used to own. Heath had quit a few different products under the "SB" series. In fact there were:

Transceivers:
SB100, SB101, SB102, SB104
All of these were HF rigs. Heath skipped the SB103, I think they DID have a prototype rig that would have been solid state except for the finals. This would have taken some of the circuitry from the SB303 solid state receiver and used tubes in the driver and final. By the time they had a prototype ready they already were designing a fully solid state version so the SB103 was never produced and they jumped to the the SB104.

The SB110 and SB110A were both 6 meter transceivers. Heath never made separate receivers and transmitters for 6 meters in the SB series.

Receivers:
SB300, SB301, SB303
These were HF ham band receivers. There was also a general coverage short wave model (I forget the model number). Heath skipped the SB302. I think there was might have been a prototype of this, it would have been the receiver section of the SB102 transceiver with the solid state LMO. However, Heath chose to develop a fully solid state version in a smaller cabinet.

Transmitters:
SB400, SB401
I guess the transmitters didn't sell as well as the receivers and the transceivers. Heath never developed a replacement for the SB401.

Linear Amplifiers:
SB200, SB201 half gallon with 572B tubes. The SB201 was the 'FCC 10 meter' law version.
SB220, SB221 Full gallon with 3-500Z tubes. The SB221 was the 'FCC 10 meter' law version.

There was no SB210 product. I think this model number was reserved for a possible 6 meter linear to go with the SB110 transceiver.

SB230 Half gallon using a conduction cooled 8873 tube.
SB240 Never produced. This was to be an SB221 repackaged in a matching cabinet to the SB104 transceiver. It might have used 3-500z tubes or a single 8877 tube.
SB1000 was not strickly an SB series product. It was a nearly full gallon using a single 3-500z tube pushed to it's maximum ratings

Other stuff:
SB500 was a two meter transverter with a pair of 6146's in the final
SB600 was a matching speaker that could house the power supply for a

transceiver.
SB610 was a monitor scope
SB620 was a pan scope
SB630 was a station console with clock and phone patch
SB640 was an external VFO for the SB100 series transceivers
SB650 was a digital frequency display for the SB series

Thanks everybody for your ideas.  Turns out that the most likely
answer had to do with one of the two 572B's being internally
defective.  I ordered another matched pair (goodbye $100) and tried
again; but as suggested, first to confirm it worked on 15 and 20,
which it did.  Then, with great trepidation went to ten meters, this
time keeping the exciter at a low output.  Tuned quickly, never more
than 5-10 secs before giving it a rest.  Waddya know, the darn thing
tuned just like it does on the other bands.  Began to raise power,
watched the plates for cherry - everything good with output to about
400W.  Since the incident I have carefully etched fine pencil marks on
loading and plate tuning so I can go back to resonance very quickly.
Even did same on the exciter.

Sometimes you never know exactly what happened, but Art Sowers hit it
right.  Amp with previous set of tubes always ran on 10M.  When it
failed filament went out, breakers tripped, flash of light, pop of
noise - probably bad tube that worked ok at lower frequencies.

Thanks again!!

The radio museum images for Crosley 4_29P might really be for model Crosley 4_29 (no P).
Does anybody have an old catalog from about 1926 that shows what a 429_P looks like and how it is a different model from Crosley 4-29? I have a 429 (no P) and it looks like the radio museum pictures for both models.

I am the second owner of a Heathkit SB-1000 that was built in the late 1980s. It was working great until I accidentally tried to tune it into a mistuned antenna and I saw a flash through the ventilation screen on the left side somewhere around the rectifier/filter section and there is now no power output. The amp powers up, the fan runs, the meter lamps light and the tube lights up. The amps multimeter shows 3400 volts on the high voltage position (a little high maybe but it has always been like that). With no drive, when the amp is keyed there is no plate current and no grid current. Keyed with drive there is grid current, but no plate current and no power output. These conditions are the same regardless of which band the amp is set to. I had thought that the zener diode might have failed so I replaced it, but nothing has changed. I would appreciate any thoughts as to what may be the problem and how to fix it.

Measure the plate, grid, and cathode voltages with a meter. Compare with the manual. Work back from there.

A failed tube is entirely possible. Inspect it for internal damage.

Some basic things to do before you start trying to measure 3500 volts, with equipment that's either inadequate or expensive:

One: Something obviously burnt. So look for something that's obviously burnt. If the tube isn't flowing current then there's a good chance that the current path between the power supply and the tube is broken. So look carefully at every component between the power supply and the tube. Trace the path from the transformer secondary to the tube, and check for char. Because you're reading voltage at the meter, you can start by going from the meter pick-off point to the tube.

Two: If you don't see anything, start measuring for continuity (still with power off). Measure the resistance from the meter pick off point to the tube anode -- it should be low (probably less than one ohm, because I think those things used a coil wrapped around a resistor for UHF suppression).

Three: Maybe you did blow up the tube. I'm not familiar with the SB-1000. If the tube has a glass envelope, inspect the area from the anode to the anode cap -- look for things that appear to be burnt and/or melted.

Four: (really, this is part of one). Sniff around. Did you notice "that expensive smell" after the bang and flash? If so, it should still be lingering, and it should be strongest at the burnt component. Use your nose to find the burnt part.

If none of this locates the problem, then go ahead and power it up and start taking live measurements -- but do observe all precautions. 3500V will have you in a philosophical discussion with St. Peter about the meaning of the phrase "suicide by stupidity" before you ever realize that you're dead. I'd have to dive into my ARRL handbook to learn about safety at those voltages, but I would imagine that you'd start with a decent high voltage probe, and go from there.

Hi,

Perhaps an open RF choke in the plate circuit?

Some Ameritron models have a series HV rectifier in the plate
circuit, to serve as a fuse.  If present, perhaps it opened.

If you are not comfortable working around lethal voltages,
Ameritron may service this model Heathkit amp.
(It's basically a kit version of their AL-80, single 3-500Z amp).

Ed Knobloch

My first thought was the plate rf choke as well. It would take QUITE an overload of plate current to blow that, but a high SWR into a bad antenna might induce enough RF current in the choke to fry it. If you are lucky the break will be on the surface and might be repairable. Otherwise a new choke is needed. Another possibility is the parasitic suppressor between the tube plate cap and the plate choke may have opened. This is easier to repair/replace.

I REALLY doubt that you blew the tube that quickly. The only way to destroy a 3-500Z in an instant would have involved frying much of the power supply as well. If the tube filament is not open and the plate isn't melted (hole burned though it!) or discolored unevenly or the glass softened in one or more spots the tube is good! 3-500Z'z die slowly or self destruct like a supernova!

SolderSmoke is the story of a secret, after-hours life in electronics. Bill Meara started out as a normal kid, from a normal American town. But around the age of 12 he got interested in electronics, and he has never been the same.

To make matters worse, when he got older he became a diplomat. His work has taken him to Panama, Honduras, El Salvador, the Spanish Basque Country, the Dominican Republic, the Azores islands of Portugal, London, and, most recently, Rome. In almost all of these places his addiction to electronics caused him to seek out like-minded radio fiends, to stay up late into the night working on strange projects, and to build embarrassingly large antennas above innocent foreign neighborhoods. SolderSmoke takes you into the basement workshops and electronics parts stores of these exotic foreign places, and lets you experience the life of an expatriate geek. If you are looking for restaurant or hotel recommendations, look elsewhere. But if you need to know where to get an RF choke re-wound in Santo Domingo, SolderSmoke is the book for you.

SolderSmoke is no ordinary memoir. It is a technical memoir. Each chapter contains descriptions of Bill=92s struggles to understand (really understand) radio-electronic theory. Why does P=3DIE? Do holes really flow through transistors? What is a radio wave? How does a frequency mixer produce sum and difference frequencies? If these are the kinds of questions that keep you up at night, this book is for you.

Finally, SolderSmoke is about brotherhood. International, cross-border brotherhood. Through the SolderSmoke podcast we have discovered that all around the world, in countries as different as Sudan and Switzerland, there are geeks just like us, guys with essentially the same story, guys who got interested in radio and electronics as teenagers, and who have stuck with it ever since. Our technical addiction gives us something in common, something that transcends national differences. And our electronics gives us the means to communicate. United by a common interest in radio, and drawn closer together by means of the internet, we form an =93International Brotherhood of Electronic Wizards.=94

Thanks to all who have posted regarding this issue, its been a lot of help. I checked the HV to plate circuit and found a blown (actually totally destroyed) wire wound resistor in series between the filter board and the plate choke. The manual and schematic doesnt show this resistor as part of the kit, so Im assuming it was a mod done by the original owner. I suspect it may be there to lower the voltage on the plate to extend tube life or to provide some safety a la Eds post regarding a RF choke to provide some sort of fuse. The problem is the resistor is so damaged that there are no values printed on it. Does anyone have any ideas as to what that resistors values would be?

Thanks
Chris

I'm betting that resistor (wire wound) was self resonant at the
frequency you were operating on, that's why it exploded. I would just
leave it out for now. If you DO replace the resistor make sure to use a
none inductive resistor and/or bypass it on the HOT end with a suitable
HV capacitor having of at least .001 uf.

Hi, Chris

That resistor in series with the plate lead is a good, standard mod.
The usual value is 10 Ohms, 10 Watts, enamel coated wirewound.

Here's a picture of one added to a Kenwood TL-922 amplifier:
http://ve3fwa.ham-radio-op.net/tl922/mod7-an.htm

(The guy used a 12 Watter there, no problem, that's a bigger amp).

The idea is that should a 3-500Z arc over, the resistor will open
(and +stay+ open). Hopefully, this will happen fast enough
to save the tube and the plate rf choke.

73,
Ed Knobloch

It's should say FOR SALE. I still have to pay Amazon money for it, which
makes it a for sale ad, just like any other.

I've enjoyed your podcasts, and I might even want to read your book, but IHMO
adversting something on this group is a violation of the charter. If you want to
sell your book, you should post it on the forsale groups as forsale, not
as available on a noncommerical group.

Since I don't have an Amzon account, and I'm not about to spend  $12 on it,
is not available for MY kindle.

Available would be more appropriate for  a PDF file you could download for
free.

Thanks for the info Ed, I have learned a lot and you and everyone else has been a great help. I removed the blown resistor and reconnected the lead and the amp works FB again, so problem solved. Im glad it turned out to be so simple. I will install another 10ohm 10W resistor to replace the blown one in the near future before I put the amp back on the air for real.

Thanks again all and 73

Hello Tony, de Piero I5SPO.

Quite a (very) long time ago, i've done an A.M. TX with a Geloso VFO and a class C RL12P35 Wehrmacht pentode, whose characteristics are similar to 1625 (a.k.a. 807 with 12.6 v filament), using a carbon mike and a step-up audio transformer.

I believe that, using beam tetrodes, there's no way... :-(

I know also 813 and 814 (have 2 pcs) and these, like 807, are useful for controlled carrier A.M. by modulating screen grid.

Do not know 803, but if i remember well, are low power tubes.

Used with suppressor modulation, their output will be one fourth
of CW rated output, and efficiency is consequently low... :-(

HTH,

73, Piero.

Hi Piero,

the 803 is about the same as the 813, though it has a proper suppressor screen. Other differences are socket (5 pin vs. 7 pin) and maximum frequency (20 MHz against 30 MHz).

What I need to know is if any one has ever tried to vary the 813 beam forming plate voltage, so as to verify whether the plate current can so be controlled. If so, I could avoid to purchase the 803s and use the 813s I already have.

I know that with suppressor screen modulation output power is about one fourth, but efficiency will not be so low because, in absence of modulation, also the input power decreases (by somewhat less than one fourth). With a pair of 803s (or 813s I hope!) I should obtain about 200W of unmodulated carrier power, peaking at 800W under 100% modulation.

I used to have a few RL12P35s, though I never actually used them. A Radio Rivista article by Dante I1DC describes a transmitter using the RL12P50 (a bigger brother of the RL12P35). But all those tubes are too small for well exploiting the potential advantages of suppressor screen modulation. As a matter of fact the advantage of not having to build a powerful modulator becomes more evident when the needed modulator would be real big!

True pentodes are needed for suppressor grid modulation. The beam forming plates have much less of an effect on plate current and trying to use them for modulation will result in a highly nonlinear modulation waveform. Remember that emission current not going to the plate will instead go to the screen grid. The power dissipation of the screen grid is what seriously limits the use of suppressor modulation.

If you already have the sockets for the 813, I would suggest the use of 4E27A/5-125B tubes. The 4E27/Heintz & Kaufman 257B has less plate dissipation, but it too might be suitable.

Please let me know if you need datasheets for either of these tubes and for the 803.

Hi Barry,

thanks for the tips. However, looking at the tubes characteristics, the main advantage of the 4E27 w.r.t. the 803 is the possibility to work at much higher frequencies (apart form the socket, which can however be simply changed with no need to make extra holes on the chassis). For the rest, it has a lower plate dissipation (65W against 125W), different filament voltage and it costs more (38$ against 25$).

I appreciate the screen grid dissipation problem but it is not clear to me why

your statement "that emission current not going to the plate will instead go to
the screen grid" would not equally apply if the tube has a proper suppressor
grid instead of bram forming plates. Could you please clarify?

This does not answer the question, but is offered as a bit of homebrew lore.
After WWII, the 1625's were plentiful and cheap. Some Ham found that with
certain brands of 1625's, the suppressor grid was not tied to the cathode
inside the glass envelope. The two were tied together inside the tube base.
So, after removing the base, the two elements could be separated from each
other.

The aim was, guess what? Suppressor-grid modulation! I can remember
hearing some of these rigs on the air. I don't know just what percentage of
modulation was possible, but I remember it being pretty weak. Good strong
signal with very low modulation level.

The aim had been to use what parts one had, and it surely was an inexpensive
way to join the AM crowd!

Actually I did _not_ do a good job of explaining this. In a pentode, the suppressor grid controls the ratio of the emission current going to the screen to that going to the plate. It also eliminates the problem of secondary emission. Beam forming plates are specifically designed to control secondary emission, but they have much less of an effect of controlling plate current. Rather than going into detail here, allow me to refer you to Karl Spangenberg's book, "Vacuum Tubes." This book is now available on several websites. Chapter 11 goes into great detail on how both pentodes and beam power tubes work and how they differ. I would also refer you to O. H Schade's classic paper, "Beam Power Tubes," which is also available on many of the same websites. Pete Millet's site is my favorite with many excellent technical books. http://www.pmillett.com
One trick to reduce screen grid dissipation in suppressor modulated pentodes is to power the screen grid with a voltage dropping resistor from the plate supply rather than use an independent supply.

While not available in power tubes, many receiving pentodes are designed such that the suppressor grid acts much like the grid in terms of its transconductance. The 6AS6 is probably the earliest example of such tubes. They make good mixers.

In the 1957 ARRL Handbook, these particular tubes were also used in a
cathode driven (grounded grid) amplifier.

Thanks for your answer.

A negative suppressor grid then tends to "isolate" the plate from the rest of the tube.

So, the effect is similar to when, if the plate voltage of a power audio amplifier stage is removed by accident, the screen gets quickly destroyed due to excessive power dissipation.

I shall then carefully check the screen dissipation in the suppressor-modulated transmitter I am planning to buld.

Thanks and 73

Yes, I was aware of the "modified 1625" but for linear amplifier usage. Now I
know that they were also used for suppressor-grid modulated stages.

But now a doubt come to my mind: the 1625 is a beam-power tube, not a pentode
(actually it is an 807 with 12.6V filament). So, how could it work in
suppressor-grid modulated stages?

I got the following note from Dick Newsome, WØHXL. I thought it worth passing on. Many of us "older" hams remember Leo Meyerson, the founder of World Radio Laboratories (WRL). My first transmitter, nearly 50 years ago, was a WRL Globe Chieftain Deluxe. It put out a mighty 90 watts of CW and AM phone. Thanks, Dick for sending this note:

Leo is also a member of Omaha Chapter 210
73, Dick W0HXL

Hi Everybody,

On Feb 24th QCWA Chapter 154 in West Palm Springs is celebrating Leo's 100th birthday. For those that don't remember Leo owned and operated World Radio Laboratories in Council Bluffs, IA for many years.

So here's the plan, take a QSL card, write 'Happy 100th Birthday Leo' on it and send it to:

Leo Meyerson, W0GFQ
19 Park Lane
Rancho Mirage, CA 92270

Gene Pentecost, President of Chapter 154 will make sure they get to the party so everyone that attends can enjoy them.

One last thing, tell every ham you know to do the same thing, QCWA member or not. Spread the word, at every radio club meeting you attend, at every net you check into.

I want Leo to get hundreds, maybe even thousands of cards.

tnx es 73,
Bob Roske, NØUF

Read Lynn's post again. He said the carrier was strong but the audio was quite weak. It is quite difficult to get over 95% modulation with a suppressor modulator. With beam power tubes, you get far less than this. Also you get lots of distortion because the beam forming plates do not linearly control plate current, so you have to lower the modulation level even further to make the audio readable by listeners. Hence the "strong signal with very low modulation level" makes sense. Fortunately with pentodes, it is easy to drive the output to zero (negative modulation). The real problem occurs when the suppressor is driven very far into the positive voltage region and it starts drawing current. Typically the suppressor grid can only dissipate a few watts. Since current is drawn during the positive peaks, an audio driver must present a low impedance.

My experience was about 25% modulation, and that was with distortion that
was... well... kind of bad.

I would characterize this as pretty much the worst quality AM ever, worse
than screen grid modulation by a long shot.

And this also quickly becomes a distortion source unless the audio driver
stage is pretty hefty.

Just say no.

Ah, yes, "(negative modulation)"!

You seem to be "hep" on old stuff, do you remember "negative peak
clipping"?
I thought I was in Heaven in about 1958 with a single 2E26 final on 15
Meters.
In class C, with a pair of 6L6 modulators, push-pull, class AB1, and used a
VR
tube across the modulation transformer secondary clipping the negative

peaks, while
allowing the positive peaks to go "over" 100%.

Technical gurus of the day poo-poo'd the scheme. It looked a little
rough on the
scope, but unsolicited signal reports said it "packed a lot of modulation".
I am thinking it must have been a little like more modern amateur
"speech
processing"

I also seem to remember those modified 1646's getting almost 20%
suppressor
grid modulation after tinkering around with power supply voltages.

Hi Lynn,

A pair of 6L6's to modulate a 2E26... there was enough audio to drive a 6146 with a some to spare and enough to really overmodulate a 2E26! :-)

Negative peak clipping was based on a diode with its anode connected to B+ and its cathode connected to the output side of the modulation transformer. This would allow the final's voltage to drop to only a few volts during negative modulation peaks. Later refinement was to add a gaseous voltage regulator tube between the diode's cathode and the output side of the transformer. In this case, the final's voltage would only drop to a voltage determined by the regulator tube. Today a silicon diode might be used, and zeners would replace the VR tube. The result of this circuit was that the RF would never be completely cut off during negative modulation peaks. Positive modulation peaks would be passed allowing higher positive modulation. This is what gave the higher "talk power." It still caused distortion, but much less than that if the negative peaks were not clipped.

Everyone's voice is asymmetric. If you look at the voice waveform with an oscilloscope, you will see that peaks on one side of zero are often considerably higher that the opposite polarity. The average is still zero, however. The peak is caused by harmonics in the voice being in phase with each other. This property can be used to advantage in amplitude modulation by having the peaks occur on the positive modulation. Usually all that was needed to put the peak on the right side was to reverse the connections to the modulation transformer or to reverse the connections to the microphone.

I am sure Scott Dorsey knows more about this than I do, but CBS produced two devices called the Audimax and Volumax that shifted the phase of the audio as a function of frequency. Another term for these devices is phase rotator. Kahn Communications also was in the market with its SymmetraPeak. To the ear, the sound was unchanged, but to the transmitter, the peaks became symmetrical. There is an excellent discussion of these devices on James Tonne's (W4ENE) website http://www.tonnesoftware.com/appnotes/allpass/allpass.html and on Gary Blau's (W3AM) website http://www.w3am.com/8poleapf.html. {A biased opinion here � Jim's site contains some _excellent_ free software.}

As to being "hep" on old technology, I appreciate the compliment. As an undergraduate, my university taught tubes and transistors. By the time I got to graduate school, tubes were no longer taught. By the time I got out of graduate school, integrated circuits were the "in thing" and microprocessors had just begun. I do have a good collection of older engineering books, however. I am constantly amazed by the technology of the late 1920's and the 1930's. And it was all designed without the benefit of computers! While I haven't used it in years, I still have my K&E metal log-log-decitrig slide rule, and the bamboo rule I used while in high school.

Help! bought a clean unmodified 101A, only to have the back painted
dial glass broken in transit. It appeared well packed and I can't prove
how it broke. I need a good dial if anyone has a parts rig with the
dial. Willing to pay a fair price. RadioDaze sold the last one.

The original Audimax/Volumax combination had no phase rotator. I worked at an AM station that used them, and the chief engineer had installed a phase reverse switch on the announcer mike and auditioned each announcer to tell them which position to use. (Apparently they had used figure-8 mikes a year or so before I got there, and the announcers just used the front of back of the mikes).

A lot of stations using the Audimax/Volumax would also have a phase rotator in the chain, though. CRL made a popular one, and so did Garron. Some folks made some boards tht dropped inside the Volumax for it too, but I never used any of those. I went to the Optimod as soon as I could, and it has a great phase rotator.

The phase rotator is a hell of a great gadget, it gives you a lot of loudness without any perceived distortion. Mind you, for communications applications it's no more effective just than aggressive clipping, but there are folks who don't want aggressive clipping.

Thanks for the corrections, Scott.

Aggressive clipping creates a ton of distortion unless the voice signal is split into several bands, each processed and filtered, and then combined. The phase rotator theoretically produces no amplitude distortion, and due to the way the human ear works, the shifting of the phases is not heard. I read once that the cochlea and its nerves perform physiologically something akin to a mathematician performing a Fourier analysis. I find it amazing that we process sound, for the most part, on the amplitude versus frequency information, and ignore the phase versus frequency information.

With modern operational amplifiers, it is fairly simple to produce a good phase rotator using cascaded all-pass networks. I would hate to have to manufacture the original SymmetraPeak with its inductor-capacitor network lattices.

Well, we are pretty far from the original subject, but I have enjoyed the discussion. However I do have a Boatanchor question.

I remember seeing ads in QST in the 1960's for a device I think was called "Echoplex." It was supposedly used on commercial and military voice communications circuits. I never heard one of these in use by a ham, probably because their cost could buy several Collins S-Line stations. Doing a Google search brings up lots of echo-effects processors for guitars and such, but I found nothing for communication usage. Do any readers here remember the device and its manufacturer and how it worked?

Right. I think for communications use, though, the ton of distortion can

actually help intelligibility of consonants under bad conditions. Certainly
it gives you a distinctive sound in a pileup.

I have only heard of the echo-effect box. "Everything I use must have
X in it, like sex and echoplex" says Lee Scratch Perry.

I have a feeling it's another name for Lincompex, developed by the British Post Office in 1966. Bell labs in the US apparently then came up with something very similar - which I seem to remember was named "Echoplex". Could be wrong - it was all a long time ago.....

Lincompex stands for LINKED COMPRESSOR and EXPANDER. The audio is heavily compressed, and the pre-compression amplitude variations are used to frequency modulate a 2900Hz control tone. This is combined with the compressed audio (300-2700Hz) and fed to the TX. At the other end of the circuit, the control tone is used by an expander to restore the original amplitude variations.

Lincompex was used widely on international point to point SSB and ISB voice circuits - and may still be in use (?)

The equipment was made by Marconi, and possibly ST&C (as was, before Nortel bought them up).

You are both right.

On a 1966 issue of QST magazine, I found the advertisement of "Echoplex" by Kahn Research Laboratories. It sold for more than 300$, which was not cheap at those times.

As to Lincomplex, I remember a friend of mine working for Page Europe who told me having installed Lincomplex on HF transmitters in Africa.

Thank you, Tony.

Somehow, I think you are talking about Leonard R. Kahn of Kahn Research
Laboratories in Freeport, Long Island, NY, and not A. Q. Khan of Khan
Research Laboratories in Kahuta, Pakistan (Pakistan's main nuclear
weapons laboratory as well as an emerging center for long-range missile
development). Leonard Kahn is best known for his paper: L.R. Kahn,
�Single Sideband Transmission by Envelope Elimination and Restoration,�
Proceedings of the IRE, Vol. 40, July 1952, pp. 803�806., and for his
work on AM stereo. Google somehow doesn't know the difference...

Yes, it was Leonard Kahn. I have an Kahn SSB adapter for 455-KHz IF receivers.
It employs a great deal of nuvistors. Very complex machine!

This is not funny, Barry.

If it were me, I would look through early issues of the Handbook looking
for transmitters using that final AND for simple three-stage Novice
transmitters and marry the two.

5933 = 807W

Any transmitter circuit using the 807/1625 as a final can be used.

Most ARRL handbooks from the 50's and 60's had such transmitter circuits. If you are a member of the ARRL you can download PDF's of QST articles and can search the back issues by topic.

To add to good advice Scott and Kenneth have given, circuits using the
6146 would also be suitable to copy. I would use a VFO operating on 1.75
to 1.8 MHz for stability with the first tube, doubling in the second
tube. On 80-meters the final would operate straight through. while on
40-meters, you would double in the final. Such an arrangement would
generally not require neutralization with the good shielding of the 5933
(a mechanically ruggedized 807).

I'm building a transmitter *similar* to this one. I'm using a 42 tube as the buffer. So far its working out well. About 20-25 watts out on 80, 40 and 30 meters with a good tone even keying the VFO.

I'm using plug-in coils for the buffer and PA. VFO is running at 3.5 Mc on 80/40 and 5 Mc for 30.

Unfortunately I don't have a schematic drawn up that I can post since its still a work in progress.

Hi, Gang

I recently posted about a DOS program by KQ6RH,

to convert from RX noise bridge knob settings
to impedance, in both polar and rectangular form:
http://www.antenna-magic.com/Rx_brdg.htm

My only "complaint" was that his program didn't also
output the SWR for a 50 Ohm system.

I realize that I can get the SWR info
from a Smith chart, but the charts I have found
for free download are centered on R=1,
and require quite a bit of squinting to use.

Anyway, I stumbled upon a very handy graph
of SWR vs. R +jX (for SWR < 3.5:1),
appearing in RCA Ham Tips for Dec 1956:
http://bama.edebris.com/manuals/rcahamtips/rca1604/

Ed,

I can offer you a very simple formula that you can directly copy and paste into cell D1 of an Excel spreadsheet:

`= -(RADQ(B1^2+(A1-C1)^2)+RADQ(B1^2+(A1+C1)^2))/(RADQ(B1^2+(A1-C1)^2)-RADQ(B1^2+(A1+C1)^2))`

then:
- in cell A1 you put the load resistance (ohm)
- in cell B1 you put the load reactance (ohm)
- in cell C1 you put the line characteritic impedance (in ohm, typically 50)
- in cell D1 you read the SWR ratio

You will only have to replace RADQ with the American locale symbol for the square root (SQRT I suppose).

Crazy Excel which also translates symbols!!!!

The reason that the 6146 tube generally requires neutralization and the
807 does not is because of the higher gain of the 6146.  The 6146 will
draw greater plate current at a lower screen voltage (with the same
```

plate voltage) than the 807. It is the higher 'gain' of the screen grid that matters here (since a screen grid tube acts as two triodes in cascade as far as power gain is concerned). The 6146 is actually better shielded than the 807 and has less lead inductance which helps stability. In order to avoid neutralization the 807 requires extra shielding to keep the grid from 'seeing' the plate. Sub mounting the tube socket below the chassis so the bottom of the plate is even with the level of the chassis will do the trick. James Millen sold tube shields for the 807 which were aluminum cans open at both ends with spade lugs to mount to the chassis. With the 807 sockets mounted to the chassis and the shields mounted on the chassis, the tops of the cans would be just below the level of the bottom of the 807 plates.
Recall the AN-ARC5 transmitters? They sub mounted the 1625 tubes so the plates were just at the level of the chassis, same idea.

Neutralization becomes more of an issue the higher you go in frequency. Most simple entry level transmitters using a single 6146 in the 1950's and 1960's were not neutralized as the 6146 was only used "straight through" on 80 or 40 meters. On higher bands it was used as a frequency multiplier/power stage. The Eico 730, the Elmac AF67, the Heath DX-20, DX-35, and DX-40, and the Knight T60 used no neutralization. The Eico 723, the Heath DX-60 and the Drake 2NT. however, did. If used on 80 and 40-meters only, I seriously doubt if Frank will need neutralization with his 5933 as long as the driver tank is located below the chassis and the final tank circuit is above the chassis. A shield around the base of the 5933 is a good idea, of course.

In the 1936 issue of QST, an article entitled "Operating Notes on the Transmitting-Type Beam Power Tube" noted:

"Careful tests show that with shielding of this nature the tube has no tendency to oscillate at frequencies up to and including the 7-Mc. band; it functions as a true screen-grid amplifier. On 14 Mc. it will self-oscillate after a fashion, but usually with negligible power output.

When separately excited, however, it settles down nicely and behaves like any normal amplifier, showing no tendency to go off on its own � this, too, when driven by the fourth harmonic of a Tri-tet oscillator operating at a very low power level. On the whole, therefore, we have found no occasion for attempting to neutralize the tube, which is fortunate, because it is always a rather messy job to neutralize a tube with such low grid-plate capacity."

Hi, Tony

Thanks for the Excel SWR formula, but I am scratching my head -
it looks like the denominator would be negative.

You are right, it is SQRT for the equivalent English Excel term.

The way I've seen SWR worked out, they usually solve the complex
reflection coefficient first (gamma), and then go from there.

Ed

My experience with 6146's (and one time with a 5933) was that from 40 meters on up, they could be easily be made to self oscillate if they were lightly loaded. (talking final amplifier stages), and this is where a poor man's neutralization procedure took place)

When lightly loaded, or better yet with no drive at all, swinging both the input and output tuning condensers (sometimes referred to as "capacitors") would induce an oscillation on the
intended band of operation. A single piece of wire used as a negative feedback condenser could be wiggled about to find a place that tamed things

down.
Only problem with this was that the rough neutralization achieved was frequency (or band) dependent. Usually it would be "good enough" if neutralized on the highest band to be used.

Parasitic oscillation was a whole different problem, and didn't seem to care much if the stage was neutralized or not!!!!!!

Ed,

something odd has occurred.

In the formula I sent you with my initial message there are some "exponential symbols" (an arrowhead pointing upward) that do not show in the formula appearing in your answer message.

It looks like those symbols were removed by the system, either on the way from me to you or in the way back from you to me.

I am resending you the formula (with SQRT in place of RADQ), where I have substituted the exponential symbols with the percentage symbol (hoping that system will not cut the percentage symbol too...)

= -(SQRT(B1%2+(A1-C1)%2)+SQRTQ(B1%2+(A1+C1)%2))/(SQRT(B1%2+(A1-C1)%2)-SQRT(B1%2+
(A1+C1)%2

I have re-checked that the above formula works fine on my Excel. If you wish to try again, you would have to replace the percentage symbols with the exponential symbols.

Damn fingers. An SQRT has become an SQRTQ (a Q more)

This is the correct formula:

= -(SQRT(B1%2+(A1-C1)%2)+SQRT(B1%2+(A1+C1)%2))/(SQRT(B1%2+(A1-C1)%2)-SQRT(B1%2+(A1+C1)%2

Several of the transmitters I named also used TV sweep tubes. In general, all of the higher power TV sweep tubes have a higher perveance than does a 6146. In the case of the 6HF5, the transconductance (plate amps/grid volts) is 1.6 times that of the 6146. My point was that with reasonable layout, neutralization would not be required. All of these transmitters multiplied in the final above 40 meters. If the plate is tuned to a harmonic while the grid is tuned to the fundamental, there is far less need to neutralize.

Hi, Tony

I cut and pasted the expression right from Excel,
which looks like it should go thru Usenet without format trouble:

=-(SQRT(B1*B1+(A1-C1)*(A1-C1))+SQRT(B1*B1+(A1+C1)*(A1+C1)))/(SQRT(B1*B1+(A1-
C1)*(A1-C1))-SQRT(B1*B1+(A1+C1)*(A1+C1)))

It works fine business!
Thank you very much.

     You are surely correct there, Barry. I guess my homebuilt rigs never
multiplied in the final stage. I did try multiplying with a 211 (VT-4C)
triode in the final (read BC-375), but the power output instrument (75 watt
light bulb) was not impressed. (it did, of course have elegant Hammarland
neutralizing condensers in the plug-in tuning units)

I think I am detecting a hint of sour grapes here, Eddi. My post was a reply to Ken Scharf's post saying the 6146 would be more stable than the 807 because of its higher perveance and lower lead inductance. The TV sweep tubes generally have considerably higher perveance than the 6146. As for lead inductance, some TV sweep tubes had exceptionally long leads to reduce "blivets" (a.k.a. snivets, VHF parasitics sometimes associated with Barkhausen oscillation); these were unsuitable for use in transmitters above 7 MHz or so. One lot of 6HF5's ran the cathode lead from the top of the tube to the base; these barely worked on HF [Bill Orr W6SAI, "Full Blast" Operation of TV Sweep Tubes, Ham Radio, April 1968].

Yes, the Eico 730 was a typographical error. It should have been Eico 720. The DX-20 used a 6DQ6A which has only slightly more transconductance than the 6146. The Knight T-60 also used a 6DQ6. The AF67 used a 6146 with no neutralization. (Another rig I did not mention was the Eico 753 which used a pair of 6DQ6's _without_ neutralization but in AB1 linear mode. Of course, in AB1 it could not frequency multiply in the final.) The 6146 has only a slight increase in gain over the 807.

As to whether receiving and TV sweep tubes should be included in the discussion, 6L6 tubes have been used by hams in transmitters since the 1930's. In fact, the 1614 was a 6L6 designed for RF service. RCA even notes that curves for the 807 apply to the 1614 within its maximum ratings.

The original poster, Radio Vintage, wanted a simple 2 or 3 tube 80/40 meter transmitter with VFO. For circuit ideas, I believe that the large number of articles using TV sweep tubes should not be ignored. The discussion was not specifically about neutralization. I suggested doubling in the final as a means to simplify the design in that neutralization would likely be unnecessary.

When the 6146 was used as a class C final neutralization was optional (except maybe on 10 meters). As a linear amplifier neutralization will lower the IMD and is a good idea for a clean signal. Most SSB transmitters with 6146's in the final were neutralized.

BTW on 2 meters the 6146 is ABOVE it's self neutralization frequency and HF neutralization circuits don't work. Sometimes a tuned trap in the screen did the trick, sometimes INCREASING the plate/grid feed back with a gimick capacitor was used. Also grounding the metal base with spring fingers instead of the base pin at the socket might be required.

If TWO 6146's were used in push pull on VHF a conventional cross over neutralization scheme with gimick capacitors vs the tube plates worked out well.

Fellow boatanchor enthusiasts,

I'm going to replace the 500 pf TV style doorknob blocking capacitor
in my Johnson Viking Valiant (original not II) and will use a larger
value doorknob designed for higher RF current. I've heard 160 meter
output can be improved if a larger cap is used but have not heard what
value to strive for. Any suggestions or experience?

And don't forget the Old Gear Junk and Amplifier Builders' Net, and
the Drake and Antique Tube Gear Net.

Evan, K9SQG@ARRL.net

I'd try doubling it. There isn't really any way to have too large a value
(until you get so large that it takes some time to charge up when you put
the key down, and that's many orders of magnitude larger). However, big caps
are not cheap and I suspect you'll see diminishing returns pretty quickly.

UHF homebrew transmitter with a PL-4D21 tube. Great looking. A Motorola
Power Supply that has the high voltage transformer already removed for
shipping. However, I don't expect that anyone wants to pay for what I
would
charge for packing this PS and transformer. So this is for pickup here
in
Auburn. The actual net weight is: Transmitter 8 pounds. Power Supply
75
pounds. and the transformwer 50 pounds. If I pack, will want $75 for my
labor and materials, plus the actual FedEx charge.
I know nothing more than what one can see about these items. I would see
the power supply with transformer separate only after the transmitter is
sold. I have no way of setting a price for these items. Please make an
offer.

Well yesterday I knew less than nothing about shortwave details, today I know twice as much thanks to the forum and it's sponsors and advertisers. Lol.... Serriously though.... I'm finding a wealth of information and quickly. My first couple sw recievers were one from Radio Shack, and then a Hitachi boom box CD/AM/FM/SW/CASSETTE unit with amazing clarity and tuning. Wish I could find info on that unit, and look on ebay for one to purchase again. Right now I have a Hammarlund HQ120 which I just got out of NY on an ebay auction. I'm still awaiting its arrival so some of you might remember your first ebay purchase of a radio and remember it fondly. It looked nice in the pictures, but as always came with the usual "I'm a florist and know nothing about this unit".... the bulbs light....duhhh. Well I suppose I'd better get used to those kind of representations if I continue collecting on ebay and elsewhere. I'll put a picture if my 'Darlin' up here. I'll need to be finding a manual next and a plan of attack on cleaning and addressing this unit to get it back into presentable top form. I'm looking forward to getting aquainted to the members and 'Sages' here on the forum..

Hi Folks
I have a FPM-300 with a few dead xtals. I can order the xtals but I have no clue about the designation of the mount or the pf/ohm of the xtal.

The manual has part numbers but none of the other information. (see below)

As far as the size, the manual describes needing a "type CR-55A/U or CR-72/U for HC-18/U holder" but http://jancrystals.com/chart.html and others only describe other specs (HC25 plugin can) that appear to be the same size.

How wrong could I be in ordering a xtal that physically looks right at the proper freq?

CR405	43.0Mhz	019-04749
CR406	43.5Mhz	019-04751

NS-

Holders that look similar may have different pin spacing and/or diameter. In addition, the crystal must match the circuit it is used in. Choices may include impedance, whether it is series or parallel resonant at the specified frequency, and load capacitance of the circuit.

Crystal manufacturers often have a collection of data for equipment for which they have provided crystals. You need to talk to someone at the manufacturer to find if they have crystal data for your specific equipment. If not, you must provide the crystal's circuit diagram so they can determine the necessary parameters.

Jan Crystals has been around for a long time, so may have your crystal
data in their files. International Crystal and Bliley Technologies are
also older companies that may have extensive data.

If you call up ICM or JAN, they will almost certainly have the required
specs in the book and they can tell you exactly what you need. Expect
to pay $20 each or so.

>How wrong could I be in ordering a xtal that physically looks right at

If it's designed for different load capacitance, it won't be right on
frequency. For an application like this, that's not critical but it
might require a little tweaking. Just call them up and they'll know
how to do it precisely.

Actually that's not true with plate modulation. The coupling cap
bypasses B+ audio  through the pi network L, the safety RFC and/or a
DC path from the antenna to ground.

With the Hammarlund HQ120 that I recently purchased, If been having a great time DXing on all the bands and learning the in's and out's of this particular Vintage radio operation. However, yesterday I lost my OD3 tube. While working, I noticed that it put off a what appeared to be... ultraviolet or bluish colored light, and about mid-day the radio quit working. Wondering what might have went out, I let the radio return to room temp and later turned it back on with the top lid opened a couple inches to view the bulbs in operation. From what I could see, they all lit except the OD3 tube which I initally noticed because of the color, so I asume that is the cause of inoperability. I got online and bought a tube kit which included a complete HQ120 tube-set. I have no idea of course as to the lifespan of the old 'original' ....OD3 tube and if it's 'is' original or has been replaced sometime in the life of this radio.

Back to the title of this post.... should one operate the HQ with the lid opened for cooling or add additional fan cooling from an outside source? Also I was operating this in an enclosed cabinet with sides, top and back, with about 8-10" of open space all around the radio? The inside temp of the room was probably 60 or so degrees, so it was typical cool fall weather. SHOULD I also cool and have the hood open? and should it be in a more open environment? Thanks.........

Hi,
An 0D3 tube normally glows blue or pink when operating.
It is a gas-filled voltage regulator,
and operates like a 150V Zener diode.
The fact that the 0D3 is now dark and your radio has stopped working
indicates that you have lost the dc supply in your HQ-120.
I'd look carefully at the electrolytics in your power supply,
one may have developed a short.

Ed Knobloch

My guess would be the the dropping resistor in series with the 0D3.
The 0D3 probably supplies the oscillator and possible the bfo tubes.
So, they won't work and you won't receive anything. However, you
should be able to still get some sound from the audio stages.

The other possibility is the rectifier died and then you will not have
any audio output and the 0D3 will not light. Look for the heater in
the rectifier, 5Y3?, should be glowing.

If you detect a bad smell, then it is more serious!

The OD3 is a cold-cathode regulator tube. It's supposed to be glowing with a blue light, that is how you know it is working. You can tell it is a cold-cathode tube since the first number is a zero, indicating it has no filament.

Wondering what might have went out, I let the radio return

No, it's a symptom that you have no high voltage going into the OD3, either because it's not coming out of the transformer or because there is a rectifier or droppin resistor gone bad.

It's fine, there's probably nothing wrong with and there's probably nothing wrong with any of the other tubes either. Heat the thing up, pull the bottom of the case, and get out the meter. Work back from the OD3 plate pin to the plug and see where the voltage drops.

It won't hurt to keep it cooler and it might last longer, but if you run it with the lid open, the RF performance will be degraded since you will have defeated much of the shielding.

I have found a semi-local (75 miles away) restoration/repair shop David
De Betta in Pineville NC. I'll be contacting him this morning hopefully
to schedule a repair. At this juncture of my novice knowledge, I believe
it would be prudent................lol 'GW bush' lol, again thanks.

Same here, your regulator tube is fine, its not lighting because the high voltage isn't there. You need a decent voltmeter. You can get a cheap one that will be good enough to track down this problem as Radio Shack for a few dollars. If you have a shorted filter capacitor running the set as with it is gambling with the power transformer. Without some measuring tools you are stuck. The handbook for the receiver is available at the BAMA reflector, do a Google search for BAMA. The handbook has a voltage and resistance chart in it which will help isolate the problem.

The HQ-120-X was a very good receiver in its day and still holds up very well, it is well worth the effort to repair. Beside which its sexy looking.

I have just been working on its successor the HQ-129-X, which is very similar and am quite pleased with it.

If you don't know anything about electronic trouble shooting see if you can get some help from someone local. Power supply problems are fundamental and, in something as simple as this receiver, are not hard to find.

From the descriptions I've heard your problem is that the power resistor in series with the OD3 has opened up. The OD3 is used to regulate the voltage to the oscillator section(s) of the receiver, and with that resistor open the OD3 gets no power and won't light, the oscillator in the receiver gets no power and won't work. You will still get a hum out of the receiver as the AF section is still alive, in fact if you touch the center terminal of the volume control with a finger (through a .01uf cap so you avoid touching B+) you should get a LOUD hum. With the LO and BFO sections dead, a superhet will receive NOTHING (well if you inject a modulated 455khz signal to the antenna you should hear THAT).

Look under the chassis for a rather black resistor connecting to the 0D3 socket. Usually resistors don't go bad unless there is something else wrong, but on an old set like this all bets are off.

I recently picked up US General License. Do not really know anything. No gear, but a friend gave me:

morrow mb-585 transmitter
jackson model 562 audio frequency oscillator
morrow 3 br-1, which looks to me to be an antenna bridge

Hey, the last time I was a ham,this was sort of what we had, so I know about dry electrolytics, but I am puzzled about this stuff. The transmitter has no recent google hits. Cannot find much about Morrow, a Salem Oregon company, probably long gone.

I figure this is probably vintage and even has a little of the original packing. No manuals, but looks like good shape to me. Of course, I doubt I am brave enough to apply power. Hmm, researching a bit, I should bring up the voltage gently!

So, two questions:

1) what are these items worth for resale?
2) if I want to be a collector, what would it cost me to bring this stuff up to operation?

oh, and always the additional question:

3) hey, if I wanted to be a collector... gosh I need a morrow receiver. :-)

I looked a bit at the transmitter. 10 meter. phone, cw capability. I expect just AM. It has some sturdy big connectors and so I imagine it needs an external power supply? Something else to find maybe, but I figure the pin outs could be knowable.

The resistor is a 3K, 10W, wire wound. Wire wound resistors often go open because the joint between one end of the winding and the terminal on the resistor has opened up due to corrosion of the weld. Sometimes they can be fixed by soldering at the joint. Otherwise, this is a pretty standard value resistor and should not be difficult to replace. If its just opened up it may look just fine. If it burned up you would probably smell it. Also check the solder joints to at the ends of the reisistor and at the terminals of the regulator tube. These can run hot and fail after a long period of time.

You may find that wiggling wires around the regulator may bring it back to life, thats one way of showing up bad solder joints.

You need a decent voltmeter to do even rudimentary trouble shooting. They are available cheap from Radio Shack and other sources. You don't need anything fancy. You may find that a modern meter will read higher than the voltages in the chart for the receiver. That's because the meter used by Hammarlund, and specified by them, has rather low resistance compared to a modern meter so it affects the readings more.

Sir's & Sir ette's
Please indulge me here and throw a little education my way. Just what does a 'Beat Ocsillator' switch do? Mine is a Hammarlund HQ120 to which this question reguards. I'v searched 'Wiki' for 'BFO' and the technecal jargon (Probably infinantly simple to most) seemed to be beyond my comprehention, well sort of anyway. Please, is there someone who could put it into a 8th grade format? lol....Please explain. As a note..... when I was tuning SW broadcasts, it seemed that the beat oscillator switch on the upper right of my 120 made no apparent change in anything while listening ?

Hi,

The knob on the upper right controls a variable capacitor,
which adjusts the BFO pitch. It will only be active
if the "AGC" mode switch below it (Automatic Gain Control)
is set to "c.w." (Continuous Wave).

In brief, the BFO provides a means of hearing Morse Code. If you were tuned in to a Morse station without the BFO on, you would hear only thumps in the speaker, not an on/off audio tone.

The BFO is also used for listening to single-sideband voice transmissions, used by most hams today. Without the BFO on, those transmissions sound like Donald Duck.

I've found a manual on-line for the HQ-120X, which is an upgrade to your HQ-120, in that it has variable selectivity, but is otherwise the same as your receiver:
http://bama.edebris.com/manuals/hammarlu/hq120x/

The manual is available for free download.

Wikipedia is a good jumping off place for more information:
http://en.wikipedia.org/wiki/Communications_receiver

73 and welcome to the boatanchor hobby.

Did you try to email the guy you bought it from? Some guy here in
Redmond, OR has been selling old Chinese military radio stuff at ham
swap meets and also on Ebay. Did you get it from him?

I think that is a current production Shuguang tube but I do not have a
Shuguang databook here.

I do have a Toshiba 1970 tube handbook which lists a Japanese 1B2 type
as a diode-pentode.  Ri=500K, mu=13.5, B7G basing and 1.4V filament.

Check your circuit and see if the basing looks like that of a 1S5 tube.
If so, give the 1S5 a try, I think it should work.

Otherwise you can try tube dealers, but the 1B2 is the kind of thing
that folks try NOT to get from Shugang because there's little demand.

According to http://makezine.com/images/store/Vacuum%20Tube%20Radio.pdf the 1B2
is equivalent to the fairly common 1S5 tube.

I hesitate to say "common" but yes.

Often that failure is caused by the op twisting the cap over while in place to see whats written on the other side. In American-made molded micas this often causes the lead to break free from the molding and the twisting action breaks away a few of the foil connections. Or worse, twists them into a shorted condition.

Would an SX-24 owner be so kind to scan the SX-24 schematic diagram and send it to me via e-mail? (vernucci@tiscali.it)

The diagram on BAMA is unreadable thanks to that damn djvu compression.

Other diagrams which can be found on the web are too faint to be read.

Thanks i advance & 73.

There is a good readable schematic and alignment
instructions from Riders at:
http://www.nostalgiaair.org/Resources/914/M0008914.htm
There is another handbook at:
http://jptronics.org/radios/Hallicrafters/manuals.html
but its very low res and grayed out. It may be the same
one as on BAMA.
BTW, the owner of BAMA no longer accepts Dejavu stuff
because of the poor quality. It _can_ be better but most
users seem to want the smallest possible files and that
always makes things awful.

Not exactly boatanchor but pretty old. I obtained a Hickok 890A transistor tester recently. I can find nothing whatever about it on the web. Does anyone have a handbook or know much about them? In particular I want to know what sort of battery was used. It has clips for five batteries, three are obviously for C cells but the other is evidently for a high voltage battery of some sort. Its nearly the size of a size-D cell but its not. I can get some action from the calibration adjustment from two 9V batteries in series. I think the original must have been either a 12.5 or perhaps 22.5 volt cell. If anyone can help it would be greatly appreciated. I have posted to the test equipment list but my posts don't seem to show up there.

Thanks for info, but the file on that site in an EXE file that I do not like to execute on my PC. I see no justification for offering an EXE file instead that any other common document format (PDF, DOC, ...), and this leads me to suspect that there is some form of virus embedded in it.

With regard to djvu, in the terabit hard disks and high-speed ADSL era it makes little sense to spare a few hundreds of kybtes with djvu. Moreover the djvu reader I use (ACDsee) is a rather poor program (but maybe a better reader is available).

It is a pity that a good deal of files on BAMA are of no practical use. I am still asking myself how can people upload files on BAMA without checking the images quality first. And the answer I usually get to that question ("better than nothing") seems to me rather silly.

Anyway, in the end I found a local guy who has an original SX-24 manual, and I could then make a good photocopy.

Thanks and 73

     The file at Nostalgia air _is_ a PDF. I don't know what you

Fellow Drake Enthusiasts,

I have a 2 kc narrow SSB filter for the Drake R4C made by Sherwood Engineering. It is somewhat uncommon because it is a 16 pole filter and not 8 poles like the standard (optional) filters. I am unable to find any specs on this filter, graphs of skirt shape, etc. Would be interested in a hard copy or electronic copy of any info that is available for this filter.

Thanks for reading this post and enjoy those Drakes.

The file at Nostalgia air _is_ a PDF. I don't know what you
clicked on but look again.

Yes, they say it is a pdf file, but when you click on the download icon, its
starts downloading a file named M0008914.exe. Did you actually try to download
it and execute it?

The diagram on jptronics is unfortunately useless.

I have that filter since almost 30 years. It is three times bigger than a normal Drake filter. It bears the label CF-2K/16.

I have a one-page datasheet from Sherwood, in which they state that its bandwith @6dB is 1,800 Hz.

If you give me an e-mail address, I woll send you a scan of that page.

I have downloaded many files from Nostalgia Air, in
fact I tested this one before recommending it to see what it
was like. When I clicked on the download symbol it came up
labled as a .PDF as have all the others. I don't know what
sort of executable there could be there. What browser are
you using?

Unfortunately, the manual at the other site is as bad
as the one at BAMA, grayed out and low res.

The Opera browser reports me it is downloading an EXE file, and actually
produces an EXE file.

Both Internet Explorer and Google Chrome instead report and produce a PDF file.

Crazy!

What I got seems more than this. Its the Rider's pages for the RX. BAMA has a very low res scan and so does the other site I gave. They are so poor as to be useless while the Rider's info is quite readable and is useful for both trouble shooting and alignment. BAMA is dependant on whatever they are sent. They have a good S-20R scan because I made it and sent it. Its the one that has an added advertisement announcing the model.

At one time, there were 9 volt batteries of about the "D"
cell size
and shape.

Paul

Thanks for the reply. It might be but I tried it with a

single 9V battery and it did not seem to be enough. Two
batteries in series allowed the cal adjustment to work but I
don't want to just put 18V on it without knowing what the
actual required voltage is. I found a manual at a pay-for
site but its nearly as much as I payed for the tester.

Tony-

I don't remember how I did it, but when I found I had downloaded an EXE
file, I went back and found a different place to click. This time it
downloaded a PDF file that opened correctly.

At first I thought the EXE file might actually be a self-extracting ZIP
file. But when I changed its suffix to .ZIP, my un-zip program said it
was not.

Then I changed the .EXE to .PDF, and it opened fine!

Richard-

There is a 22.5 volt battery about the size of an AA cell, except it is square instead of round. I used one to convert the flash in an old film camera from two AA Cells to one 22.5 volt battery plus a similar-size electrolytic capacitor, as a "BC" flash system. With AA cells, the flash was not reliable. With the BC system, it never failed to fire.

I'll look through my collection of manual links for the 890. The first one I checked had an 870, with about 30 pages scanned as individual GIF images:

I may have found one at EBAMAN.com. Downloading requires registration,
which I assume to be free. It looks like 25 Megabytes if I read the
discription correctly.

It's most probably a mercury battery, either the 8.4 or 12.something
variety. As such, it's probably used as a voltage reference and replacing
it with an unregulated alkaline battery will be bad.

That's possible but there is a "beta calibration" adjustment on the front panel which is evidently for compensating the voltage.

I am familiar with the battery you mean. The clip in the tester is for something close to the size of a D cell although just a little shorter. I checked with a variable power supply and it seems to require around 18 volts to work so I can use a couple of 9 volt batteries in series but I would like to know what is supposed to be there. Anything you can come up with will be welcome. The 870 is a much more elaborate set, not much similar to what I have.

Thanks, I will have to download it later when I have access to a high speed line. I am on a dial up here. This may well be what I am looking for.

Thank you very much Fred, this turns out to be it.
While I have an A version it appears to be essentially
identical. The mysterious battery is a 22.5 volt one so I
think a couple of 9 volt batteries in series will work OK.
Its also, of course, useful to know how its supposed to be
used. While individual transistors are considered obsolete
now I still work on quite a bit of gear that has them and
sometimes something more than a DMM is desirable for trouble
shooting them.

What if gravity, charge, magnetism, etc. are nothing but phase
relationships?   Include quotes and type "phase coherence" into
Google.

Then you will find - - what Einstein couldn't - - the fact that I
stated about "phase coherence". It's at many places in Google.

It was at the #1 TOP spot, in Google, from Sept./22/2010 . . .
to . . . Oct./04/2010 (Fitz Finds a fact! - - Phase Coherence is the
reason...)

Why did it take top spot in Google?

Because this is something Einstein tried to find but never did.

I have a near mint Sencore tube tester, model TC162 and I really need
the manual so I know what settings to use for various tubes.

The Mitey-Mite testers only measure emission, not transconductance, so
all you really have to set are the pin positions. They are of limited
utility except for quick comparisons between TV set tubes and the like.

BAMA has a manual for at least one of the Mitey-Mites, and I would be

```
surprised if a call to Sencore didn't get you the full listing.  However,
I would also be very wary of emission measurements.

Another $5.00 garage sale item. I have a much better tester with the
manual in my garage but it is piled about 5 feet high. I was going to
attack it today with her so she could sort out her considerable
collection of English Literature. Kind of an obvious English major.

I'm very careful with my stuff and just want to test a 5R4-GB9t?). I
have also found a stash of tubes I didn't even know about.
Put up a wish list and I will see if I have it. I have a lot of those
damned Compactrons that were spawned in the 60's and 70's. My room mate
and I bought a brand new zenith B/W around 75 or so and it had a mess of
those tubes and a bunch of those hated 7 and 9 pin tubes.
I also have steely's from as far back as the 30's that have never been
opened. Post wish lists and if I can get my good tester found I will
test each one before money changes hands.
Thanks,
Bill Baka

Put a 5R4 in it, find the filament pins, then find the plate and cathode
by trial and error. Adjust the shunt until you get a good result with a

known-good tube, then put the unknown in. You _can_ test diodes very effectively with the emission tester.

Compactrons are basically worth nothing at all, but they are some of the damned finest tube designs ever. I have used TV tuner compactrons for 2M converters and had noise performance better than a nuvistor and better than most solid state front ends. Some really impressive engineering went into them, but they didn't have much of a chance to get used by the ham radio folks.

Hi Richard,

It's been a while but today I finally got time to run through the E773
doc for the AR88.

Testing the local oscillator stage at tube 3, I measured the D.C.
voltage across R12 and got readings of -3.0v to -4.5v, not the 3 to 3.5V
indicated. So something not right - which is good. Checked the voltage
on tube 3 and it read 90-100v. Replaced with another tube and got
similar readings. Does this mean the fault is in AF stage or this just
symptom?

Regards,
Tim

P.S. I hope to have a signal generator shortly.

I don't have the complete E773 document. The one I have
and other AR-88 manuals do not specify a voltage across

R-12m a 1K resistor. Its shown as a series resistor in the regulated voltage to the oscillator plate. Its probably part of a decoupling resistor. I would not expect there to be much of a voltage drop across it and the polarity will depend on how you have connected the meter. You should see about +150v to the chassis on one side and nearly that on the other. The oscillator plate resistor is 10K (says 10M on the schematics, that is an old abbreviation for thousands, can be confusing). Because R-12 is 1K the voltage across it will be directly in milliampers so 4V would be 4ma, not out of line for the tube. This translates to a 40V drop across the plate resistor. I don't think this is the problem.

I looked at four versions of the AR-88/CR-88 schematics and the resistor designations appear to be consistent. The document you have is a British army one so its just possible its different, I don't have their version of the schematic. Unfortunately, RCA does not have stage gain measurements in their instructions, they would be helpful.

I don't know what to suggest next. If you have checked the tubes for correct voltage and resistance at their sockets. It seems to me we discussed an error in an earlier part of this thread, something to do with the AVC and bias measurement, I think the British manual has the return point wrong.

I have one of these that I wish to get working for a 160m receive antenna.

Anyone knowledgeable with the Ameco Preamps.

It has no power supply, only has a two wires with gnd coming out of it.

One of the leads go to the on/off sw for the filaments of the nuvistor and the other appears to be for the plate supply.

I downloaded a schematic/manual from bawa close to what mine is. From what I've gathered it needs 6.3v @ 2a dc/ac for the filaments and 125 @ 50ma dc for the B+.

One thing is, it looks like someone added a 12K 1w resistor in the B+ line for some reason.

I can scan and take pix of what I have if someone could help me out with this to get it going.

thanks ... 73 Dwight NS9I

I have a Telechron clock on a Hammarlund HQ 145. It works fine but is
missing the extension shaft that protrudes out the back. To set the
clock, I have to disasseble the unit, and turn the shaft with a needle
nose vice grip.
Very much a pain in neck. Any suggestions for a fix?

Thanks, Tom Katzele

Tom, just visit a hobby shop which sells small diameter brass or copper tube. Solder a piece of tubing long enough to pass through the back of the cabinet with a little to spare. In an old HQ-170, I found that a knob designed for and 1/8" shaft fit the tubing nicely. Good luck.

Dr OMs

I am searching for a Service manual for Harris/PRD Type P2020 Vector Voltmeter with a type 2021 Sampling Head.

The voltmeter looks as being of same generation as the HP 8450 but obviously much more scarce. A search by Google does not give any usable results, at least with my limited abilities

Can anybody help?

1. Most of the Heathkit scopes are very similar inside and a manual for one
   will apply to most of them.

2. The power transformer has failed.  The HV winding is bad.

3. If the power transformer has not failed, it will fail soon.

4. Replacement CRTs are very common, because so many of these scopes are
   thrown away when the power transformer fails.

When the transformer on my precious Goldstar oscilloscope failed and no
exact
replacement was available (what a surprise!), I was faced with hanging two
or
three transformers externally. . . . .or rewind. Bit the bullet and
patiently unwrapped
and rewound the failed one. Five windings with three different size wire.
Miserable job,
but it did finally fit in it's case and except for a little hummummmumm,
seems to work
Ok.

The Heathkit ones usually lose the HV winding which is teeny tiny wire and
a real pain to work with, BUT the good news is that it's the outside winding
so you only have to unwrap that instead of all the whole thing.  I suspect
the worst quality magnet wire available today is better than the stuff
Heathkit used by a long shot.

I am looking for parts to build a portable tube transmitter-receiver
project from an artcle that appeared in the September 1950's QST.
It utilises a dual potentiometer, one gang is 2M ohm, the other is 5K ohms.
The parts list gives the 2M as "RC M13-139" and the 5K as "IRC PQ 11-114".
Do these numbers mean anything to anyone, and if so, please can you explain?
Any assistance will be greatly appreciated.

In that time frame, you could buy the front and rear portions of a dual
pot seperately and snap them together. There were versions where one
shaft turned both and other versions where the front pot had a hollow
shaft and the rear shaft fitted inside it, and they could be turned
independantly. If the second case is what you need, just use 2 seperate
pots. For the first case, you are probably SOL.

I think those are numbers from IRC, a company which still exists as part
of the Vishay empire, I think. They are probably not useful.

I think you may be able to get stacking pots still from CTS. And the
Mod-Pot system is still available but relatively low power.

But what are the pots doing?  Is this a space saving thing, or is there
some concrete reason why the pots are ganged?  Even if they "need" to be
ganged, the circuit will define why, and we don't know what the circuit
is.

Hi,

You can use two pots - one is for the rcvr audio gain,
and the other is for IF gain, as explained on page 19 of the article.
Use an audio taper pot for the 2M pot section,
and a linear pot for the 5K.

The pots are ganged because one controls the audio gain and the other
controls bias on the grid of the convertor tube. The circuit in question is
"The Mountaineer" - A Hiker's Portable,
featured in QST for September 1950.
I suppose two seperate pots could be used, but a dual pot makes life easier.

Thanks for asking, John.

Technically, the only correct place to list amateur radio equipment (and all radio equipment) for sale is the newsgroup "rec.radio.swap". Unfortunately many sellers, more concerned with a quick profit than they are with netiquette, post in every group they can think of. This newsgroup is more oriented to technical questions about boatanchors such as alignment procedures, getting replacement parts, troubleshooting, etc. While this group's emphasis is dominated by vacuum tube gear, posts on early solid state gear such as the National HRO-500 are welcome too. With the recent popularity in boatanchors, I am sure your posts will get lots of attention.

A few suggestions...

When describing a radio, note both its electrical condition (does it work, and if so, how well?), and its cosmetic condition. If you have not tested the receivers, say so. Also note if the equipment has been modified, and if so, how neat was the work. If there is any documentation associated with the equipment such as manuals, it should be included in your description. Likewise any accessories should also be described. Since the "rec" groups do not allow binaries, posting pictures is a little difficult. You can email them directly to those who ask, or if your news server carries the "alt" newsgroups, you can post pictures on "alt.binaries.pictures.radio".

I wish you the best of luck in finding new homes for these receivers.
Please accept my condolences on the loss of your friend.

Hi Barry,

Thanks for the info. I remembered some time ago some posts here about
not posting FS items, and I wanted to confirm that. I have been
selling quite a bit of gear over the years on eBay, and I had enough
of eBay's policies that give very little, if any, protection for
sellers. Nothing stops buyers from receiving an item, then stating
it's not as described (truthfully or not) and eBay/PayPal siding with
the buyer by freezing funds, etc. I even had one guy who purposely
damaged a radio I sold him so he could get his money back (it was a
commercial two-way mobile, and he bought the wrong model).

I already sold some gear on eHam, so I'll try my luck in a non-eBay
environment.

Again, thanks for the info. Take care.

I am cleaning out my library of manuals and other BA documentation. Here are some books that I no longer need.

Original 68 page DX-100 manual titled ASSEMBLING AND USING YOUR HEATHKIT DX-100 TRANSMITTER. It is in "well used" condition with check marks and some assembly notes. The cover is taped and there is a make-shift binder made of solder. What can I say?????

Clean original manual for the HQ-110 receiver that is surplus to my needs. It is in very nice condition but there is some indication that the manual was exposed to dampness as the cover shows some SLIGHT staining.

Original 32S-1 Manual 2nd Edition Dec 1958, This one's in VERY FINE condition. There is some writing inside but it is neat and relevant.

Johnson Viking I manual. This one has been well used but it's all there with no additional notes or writing.

Hallicrafters S-95 Operating and Service Instructions

National NC-183 Instruction Manual

National NC-2-40 and NC-2-40S Receivers and 2-41 and 2-42 Power Units

National NC-303 Communications Receiver, 30 pages

Hammarlund Series 200 "Super Pro" Instruction Manual 16 pages

Hammarlund "Super Pro" Radio Receiver 100-400 kc and 2.5 - 20 mc.
34 pages Published by the authoroty of the Chief Signal Officer.

Radio Receiver BC-312N, 312NX, 342-N, 314G and 344D. Military manual
TM11-850N dated 4 February 1943
114 pages, first few pages water-stained, cover missing.

If interested please reply by e-mail.

Didn't know I had TWO of these...................

This one is in VERY FINE condition.   Other than the usual grunge on the top of the chassis it's a very clean example of this late 1960s novice transmitter. The 2NT covers 80 - 10 meters CW only, crystal controlled. Underside of the chassis is spotless. Looks to be all original.

Includes original manual.

I am asking $200.00 plus shipping. If interested please reply by e-mail.

I have a DR33 receiver that has a broken shaft on the IF Filter switch.
I am attempting to repair it for a friend.

The switch is ALCOSWITCH MRC 110S with a 1/8 inch diameter shaft that is broken off right at the point where the shaft enters the switch. The IF switch knob took a very hard hit at some point in the distant past .

Would anyone have any source for parts for he DR33 receiver.? There are several web sites that list he above switch but there is no stock. The only hope maybe someone who is parting out a DR33.

Thanks for reading this.

It's not available because it is non-RoHS compatible. Use the RoHS equivalent for replacement. Mouser says they have 27 in stock and that's usually reliable.

I'm not familiar with this AMP, but in the "olden days" cathode current was often measured by inserting an ammeter (OK, a milliammeter) in the filament (it is the cathode) transformer's center tap to ground. (the shorting plug provided current path when the meter was not in the circuit)

Isn't that how this 3-500Z works too?

Hi,
Looking at the schematic of this amp,
I believe you would normally leave the shorted phono plug
in J3 (note the shell of the J3 connector isn't grounded).

Should you want to calibrate the Grid or Plate current
meter reading in the amp, remove the plug and insert
an ammeter between center pin and shell.
Henry used trim pots to set the plate and grid
current readings (VR1 and VR2), so this would have been
a factory adjustment procedure.

Note that the HV supply is not returned directly to ground, but to R10
in the power supply (the grid current sensing resistor),
the top of which connects to terminal 2

and then continues to the metering circuit in the amp.
Since the 3-500Z tube grid is connected to ground,
grid current is measured indirectly. An old ARRL handbook
will show how this is done (See the 3-1000Z amplifier
metering in the 1963 Handbook, page 207, for instance).

Ed Knobloch

Hi, Gang

While researching the Heath HD-1422 noise bridge, I found
a handy DOS program by KQ6RH designed for the Palomar RX noise bridge,
which will work equally well with the Heath unit.

See:
http://www.antenna-magic.com/Rx_brdg.htm

The allowable ranges of X sub C and X sub L settings
are -70 to +70, representing the setting of the 140pF
capacitor of the Palomar. By using the input
range of to -60 to +60, the 120pF capacitor used
in the Heath HD-1422 is also accommodated by the program.

The program takes the R and X dial settings, and the freq in MHz,
and converts them to impedance in both rectangular
and polar form. The only thing lacking is a further conversion
to SWR, assuming a 50 Ohm transmission line.

73,
Ed Knobloch

I am planning to build a suppressor-grid modulated AM transmitter.

In all the diagrams I have seen they use proper pentodes, i.e. tubes that have a real suppressor grid (e.g. 803).

I have seen no diagram using beam power tubes (e.g. 813 or 814) which have beam forming plates instead of the suppressor grid .

Before purchasing 803 tubes, I would like to be sure that 813s or 814s are really unsuitable for suppressor-grid modulation.

My question is whether, with 813s or 814s, the plate current can be actually controlled by varying the beam forming plates voltage.

Does anyone have experience on that issue?

Tony,

Have you tried the Collins reflector?   Looks like one either made for or
adapted for the military.

I believe that the RA-1 was very similar to the US-built Heathkit HR-10B, except that the RA-1 has British valves and 160m coverage, so a search on Mods for the HR-10B might be useful? The HR-10B is popular with DX-60B transmitter owners too, so that increases the knowledge base a bit.

The list of them is at
http://www.muchstuff.com/meters/metersfs.htm
My estimate is that i can get them down to about 20 file size boxes, and about 350 lbs.

I am not offering these meters individually at this time.
They are in a storage a few mile from here.

500 are round and square and large and small, and the list at http://www.muchstuff.com/meters/mtrsfs.htm is better than 98% accurate, but these 20 are part of that list.
These 20 below were in one carton I picked at random.)

The BC-453 was much sought after as a tunable and sharp bandpass (capable) IF strip for addition to a HF receiver. It tuned the near standard (at that time) IF frequency of around 455kc (OK, khz).

By pulling up on the doohickey on top of the 85kc IF transformers, the primary to secondary coupling was reduced and resulted in a fairly high "Q".

"Single Signal"? Those were the days!

The LM-1 ("crystal calibrator") was, (and is) a very well built heterodyne frequency meter. OH, how the times have changed!

Fair Radio is pretty much dried up but if you get stuck I can check to
see if I have a spare one. I made one using the right connectors from an
old radio with bad cables
Those connectors are hard to come by. Make sure your T102 transformer
has no short....common issue with Grr-5. I have 7 of them in my
inventory in various conditions...some missing the stated cable.

The RDZ is a circa 1944 shipboard receiver covering 225-400 MHz, with
manual tuning or 10-channel autotune, AM only, It is also called the
CNA-46275 unit of RDZ. If I'm not confused, that receiver, paired
with the TDZ transmitter, was used for short range ship-to-ship
communication

You should be able to hear local military airports on the thing, and
all manner of military comms.  You may be able to hear some of the UHF
satellites although most of that is now encrypted voice.

I believe that this unit may have some spur leakage and I would check
that out with a spectrum analyzer before connecting up and antenna.  You
do NOT want to be dumping spurs into the 225-400 band.

Actually, the IF is _supposed_ to be 15.5 MHz -- there may be some
calculation that would explain reception at 15 MHz???

Believe it or not we finally have the cause of Gravity !

A correct theory of gravity will show us these four (4) things:

1. It will show us why gravity also acts like acceleration (principle of equvalence).
2. It will show us the actual cause of gravity.
3. It will show us why gravitational mass and inertial mass are identical.
4. It will show us the speed of gravitational attraction.

Newton said gravity was acting at a much faster speed than Einstein.
Which one of them was right?

Having devoted a significant amount of time to thoroughly understanding the ART-13 functioning and putting it in operating conditions, I wrote an essential - though detailed - guide for those not wishing to read the 400-page maintenance book which is not very explanatory and contains a lot of unnecessary information for ham radio purposes.

"All What You Need to Know to Put an ART-13 Transmitter in Operating Conditions, Paired to a BC-348 Receiver"

http://www.qsl.net/i0jx/ART-13_BC-348.pdf

In the paper you will also find:

- building an AC power supply for the ART-13
- fully reversible modification for zero-beating the transmit carrier on the receive signal
- fully reversible modification for avoiding the transmit relay to loudly chatter when operating CW
- matching 50-ohm antennas on the low frequency bands
- building an AC power supply for the BC-348
- building an no-zero drift S-meter for the BC-348 receiver

There are over 400 meters in my rented storage.
I wish to now relinquish my proprietary rights to them.
For a small sum of money, someone else can become their master.
SO!............ for a mere $995, or best offer, plus shipping, off they go.

The movements for each of these works.
Small side issue: I estimate they can be packed in about 12 to 15 cartons,
and their total weight will be about 280 pounds. I will agree to pay for
any
amount over 300 pounds. (Considering the
total amount paid, I might agree to deliver, but only after receiving
payment in full.)

The list is at:
http://www.muchstuff.com/meterbrand.htm
Please be patient - its slow to appear.

Looking for the "rails" that are used to mount the power supply boards
for the capacitors and diodes in the Drake linear amplifier power
supplies. Perhaps you have done the Harbach or HeathkitShop retrofits
and have some extra rails. I don't need the boards, capacitors, etc.,
since I have all the new parts but I do need several of those metal
rails if you have some available. If so, please let me know how many
you have and what the total, shipped cost would be.

Thanks for reading the post and enjoy those Drakes. And don't forget the Drake nets on 40 and 75 meters.

73,

Evan, K9SQG

News article: - - Phase Coherence is the reason for the binding
attractive force in ALL the 4 fundamental forces, Proof of this is in
the following:

Our space is built up by the average amount elements are out of phase
with each other.

Repulsive forces are generated between elements that are out of phase
more than this average.

While elements more in phase, than this average (phase coherence),
produce attractive forces.

Hi,

The R.F gain on my AR88D has to turned almost fully clockwise to hear any stations. I can pick up stations across the bands but can only hear them clearly when the R.F gain is full on. I thought the pot (R46) may have failed.
I detached the RF gain pot and tested, the pot measured from 0K to 68K. The two resistors to ground are both in tolerance.

All bath tub capacitors were replaced. I had to replace dud capacitors in the RF unit to get all bands working and the odd resistors that had gone high. Up until recently the set was working OK. Then the issue with low RF gain.

All tubes have been checked and OK. I'm endeavouring to understand the RCA wiring schematic ;-) Has anybody encountered this issue before?

Many thanks,
Tim

I will never get around to using these. These were desiged to fit into
a relay rack for shore stations and are 3 1/2 inches tall. Power is
110 vac.
The F3 is a fixed frequency AM receiver now on 3.00 MHz. It is
complete and I have listened to it. In storage since.
The CW3 is a fixed frequency CW receiver,  it is less a coil and has
been butchered a bit.
Pick these up (no cost) or they go to junk.
I have the books, the books are in very good condition and I might
want a few bucks for them.
Please respond directly.

Have you checked the tube voltages, if not do that first. I think there are also stage gain values in the handbook. These will help in finding where the signal is disappearing. Using a good scope as a signal tracer will also help.

RCA draws schematics with the tube bases shown as they are which often makes them difficult to decipher. Sometimes re-drawing a part of the circuit helps.

I have downloaded the Star ST-700 transmitter manual from BAMA, but the text pages after page 10 are missing.

Does anyone have that manual so as to check what is really missing?

Hello Richard,

Thank you for answering my post. Today, I managed to check the tube voltages and V12, Anode 3, measures -1.2v, when it should be 30v. All other voltages check out.

First of all which handbook do you have? The ones I have show V-12 as the BFO with 40V on the plate (pin-3). The BFO must be turned on for this voltage to be present. If its turned off there will be nothing there. In any case, even if there is a problem at this point it should not affect the overall gain of the RX. The symptom is so general its hard to point out any one thing. It would be helpful if you could borrow an oscilloscope (I assume you don't have one) and use it as a signal tracer to see where the signal drops off. Also, don't assume tubes that check good on a tube tester really work, sometimes tubes which check good don't work in some circuits.

Unfortunately, RCA does not seem to have provided either socket resistance measurements or stage gain measurements in their data. You can find a lot of additional info on the AR-88 and its relatives by doing a web search, There are Canadian and British military manuals available with more info than the RCA handbooks. If your receiver has an S-meter installed its indication may give you a clue.

That sure would indicate something wrong. Check the value of the plate
resistor in-circuit with a meter. Is it open?

When resistors go bad, they usually increase rather than decrease in
value. If the plate voltage is way too low, it's more likely to be
something on the plate side of the circuit gone up rather than something
on the cathode side one down.

There is also a plate by-pass cap on that line, if it shorted or developed a low resistance it would pull the plate voltage down but its on the tube side of the BFO switch. I just wonder if he measured this with the BFO off. If all the DC voltages are as specified it suggests that something is not right in the RF, IF, or audio path. Signal tracing is the best way of finding out where the problem is. Now, some isolation can be had by seeing if the problem varies with the band. If it doesn't then its something common for all bands, but that could still be one of the rF amps as well as the mixer and IF stages. Another technique is to inject a modulated signal into the IF to see if its response is normal. It could be so many things that its hard to know what to suggest. Bad caps, bad solder joints, bad ground connection somewhere, resistor that has opened up. Carbon comp resistors seldom fail catastrophically, i.e., going entirely open, but can change value substantially. Usually they go up in value but not always. Wire wound reistors often open up espececially due to corrosion at the weld between the ends of the resistance element and leads. An IF transformer may have gone open (unlikely).

The RCA 88 is a very good receiver and is worth some effort to restore.

Richard and Scott,

I checked V-12 again this time with the BFO turned on and it reads 39v. I used a copy of E773 (came with the set) which had a table of tube voltages. Sorry, no oscilloscope or no s-meter. Downloaded more documentation from the web. I will try alternative tubes and double-check resistor values. This time I'll do my homework and try to be a little more specific.

Again, many thanks.
Tim

Does any one remember the original connections (tip, ring) of the LS-3.

If I remember it correcly, the speaker coil was connected to the transformer secondary, with no direct access from the exterior.

Hi all,

I am helping the widow of silent key vk3amh in australia who is in possession of one of these sets, ie the portable transmitting and receiving equipment and power supply, housed in very stout metal boxes complete with lids (I believe these are parachute drop cases). There is also have an old manual entitled "Description and Operating Instructions for Set Serial No. 45127", and a little morse code key I believe should be in the box but at some time was replaced by a more "modern" morse key. Inside the front cover of the instruction manual the first page has been cut out, and on the second one there is a rubber stamp (six-sided) with RCD 1 and underneath that the figures 27. There is also a date stamp - 7 Nov 1944.

Could you advise me on a couple of things. Firstly could you give me a estimate of the value of such an item (based on the images) and secondly, the best forum in which to put it up for sale.

I believe it is a collector's item and I would look to get pictures of all the items prior to presenting it for sale in its current state.

I dont seem to be able to upload photos into the forum. They can be found at http://www.flickr.com/photos/91717622@N00/

Thanking you in advance
CJ

1. The clandestine radio guru is Jon Paul at Scientific Conversions and
   he would be the first person I'd contact.  If anyone knows what it is
   and what it's worth, it would be him.

2. You cannot upload photos because this is Usenet, not some kind of web forum.

Did you download the manual? Look at www.tentec.com under downloads then obosolete manuals.

The other place to ask is tentec@contesting.com, but you may have to sign up first.

I like to operate boatanchors in the way there were supposed to operate. So, if the ART-13 was not designed to operate on the 80 / 75 MHz band with a 50-ohm load, I'll just give up.

What I would like to know is whether all the ART-13s behave that way, or I should instead suspect that a problem occurs on my particular ART-13.

So, I am looking for somebody who can readily fire-up an ART-13 and confirm or deny my experience.

In the CQ surplus conversion manual, the one of the chapters on the ART13 refers to using a 118' flat top antenna feed with a single wire feeded 17' off center (windom?). The author claims on 80 it acts as a singe wire feed matched impedance half wave. On 40 and 20 it is a large T type Marconi. So someone got the rig on 80, but using an old style wire antenna. I suspect using a modem coax fed antenna with this rig on 80 may be a problem.

Also note that art13's can't normally reach 10 meters, but they have been converted to this in several ways. One way was to install and extra multiplier stage where the optional low frequency unit would have been installed. An extra 10 meter tank coil for the 813 is also added. Operation on the lower bands is not affected.

There is something to be said for leaving the rig as it was in the airplane, but I suspect most hams modified these radios somewhat to make them more useful for civilian use.

Check on the ARRL website and search the QST back issue index for articles from the late 40's through early '60s and you should find some articles on the ART13.

I seem to recall some problems with TenTec's verniers - particularly in the case of the Century 21. Dunno if it applies to your rig.

Hope its an easy fix for you.

As I recall there is a sort of planetary gear arrangement made with
ball bearings used to scale the shaft down.  You may be able to free
it up just by squirting a little Super Lube or something in there, but
the real solution is to disassemble, clean, and regrease it.

Kenneth & Thierry

thanks for your answers.

I have found many articles on the web (including the Surplus Conversion Manuals), but nowhere I found a clear statement that the ART-13 cannot work on 80 meters with a 50-ohm antenna (and that a modification is therefore necessary).

At present, my main concern is to ascertain whether my particular ART-13 has got a problem (I hate to have radios that are not perfectly functional), or instead all ART-13s do not work on 80 meters - by their design - with a 50-ohm antenna.

In the second case, I will just give it up and use - on 80 meters - one of the many other AM radios I have.

Same conclusion for 10 meters (I have seen that complex modification, but it may perhaps be worthwhile for those having just a single radio).

I recently aquired an R-388. Its in good condition but I found the S-meter read very low. From the entries in the archives of the Collins Collector's List this seems fairly common. I found that the problem was R-163, a 160ohm resistor in series with the meter, it had increased in value to over 200ohms. After replacing it with a good 160ohm film resistor the meter works normally. There is also a 100 ohm resistor, r-170, between the meter + side and ground. The voltage to ground from the screens of two IF stages through this resistor establishes the reference point for the meter. I changed this resistor also but the old one checked good. Evidently this resistor is critical because even though the difference between the two resistors was only about five ohms the zero adjustment had to be reset a fair amount.

The meter now goes up to about 95 or higher on maximum signals and off scale with manual gain.

I am posting this in case it proves of help to someone else with a similar problem.

FWIW, the meter on the 51J series reads decibels above the AVC threshold. This is not an absolute level but is approximately 2.5 microvolts on all but Band-1 (the BC band where the receiver is deliberately desensitized). This is different than the meter on the Hammarlund Sp-600-JX, which reads carrier level and is calibrated in db above and below one microvolt. When these receivers are working right the meter is surprizingly accurate.

Should you be interested to know it, I finally found a very good match on 80 meters putting an external 2000pF capacitor in parallel to the antenna. Switch position is no. 6.

Tnx Paul W2EC for hint.

OK now I know...remove covers remove all knobs,remove ring bezel,remove front panel,,remove digital readout.,remove a horizontal (LtoR) support bar.remove VFO assembly..the planitory gear drive was frozen because of dried grease..it cannot be disassembled so ,you take a dropper and keep dropping a degreaser (I used Naptha) on the vfo shaft and keep working until it frees up.These drives work on friction and always seem to work better in a dry condition..no lube..it is now free and smoothe, and solid ..feels good and tunes good..Not a job for a person with no patience..hi..   thanks for response..Harold

Yes, I had tried to add some capacitance, but not as high as 2000 pF!

Some of the schematic diagrams of war times radios - though not all of them - adopt an odd way of identifying resistance values.

For instance a 200.000 ohm resistor is marked "200 Mohm". The "M" means kilo, not mega! Conversely a 2.000.000 ohm resistor is marked "2 Megaohm".

Does any one know the origin of this way of marking resistors and when it was abandoned?

It was based on the Roman numeral "M" representing 1,000, but I don't
know when it stopped being used.

I still see "M" being used to represent thousands of dollars, and MCF is
still a pretty standard representation of "thousand cubic feet" of
natural gas.

Living in Rome, I should have known... hi.

I have a diagram dated 1953 in which M still represents 1000. In that diagram they use MF for microfarad (on the other hand a thousand farad would not make sense).

Good to know, I would not have suspected that M$ could mean just a thousand dollars and not a million dollars. We here commonly use MEuro for million Euro.

Among the odd markings:

- in the 60ies it was fairly common to use kpF (kilopicofarad) to mean nF
(nanofarad)
- in the 30ies, German power mica capacitors were marked in centimeters (cm). 1
cm is equal to about 1.1 pF

just picked up a Motorola FMTRU 80 D, no tubes, no crystals, no dynamotor, otherwise seems to be complete. If you are interested, contact me at the email address on my web page and I can send you a picture. This unit is dated 1953

This site http://www.wb6nvh.com/Moto42/Moto42.htm has interesting info on it:

80D and 140D: These were the industry standards in the 1950's and made in the greatest quantity.. The FMTR- or FMTRU-80(D) and FMTR- or FMTRU-140D are 15" wide cased mobiles which usually used Sensicon receivers with high power transmitters. In some instances, a less expensive "Unichannel" receiver was used. The 80D used a pair of 2E26's while the 140D used a single 829B in the transmitter power amplifier. The 80D was nominally a 30 Watt transmitter while the 140D was nominally a 60 Watt transmitter. The power supply used a vibrator for the receiver and a dynamotor for the transmitter. The Research Line enjoyed widespread popularity and such a long service life that most of them were converted to 12 volts after the auto industry switched battery voltage standards in 1956, and many were also converted to comply with "narrow band" FM requirements mandated by the FCC in the early 1960's. In the mid-1960's, Motorola even offered a field modification kit which replaced the vibrator/dynamotor power supply in the 80 and 140 series with a 12 Volt transistorized power supply, which included a heat sink which bolted to the front panel and instructions to overstrike the model number on the ID plate to read FMTR-140(T) or FMTR-80(T) as appropriate. The chassis used in

these mobiles were also used in all manner of upright cabinet base stations,
desktop base stations, repeaters and so forth

Yes, but for some reason 5nF was not of common use before about 25 years ago.
.005uF or 5kpF was the standard, who knows why..

Wow. the 80D was the first 2 meter fm rig I ever owned. Got it from
Western Electric via local radio club. Installed in our 1963 Plymouth
Valiant. Seemed like it took up most of the trunk space. I think it
was dual channel, but that was not a problem as there was only one FM
repeater in Portland at that time. One channel repeater and one
simplex. Ah, those were the days!

Thanks for the tip, Richard. I will look for this issue next time my

But cps and c/s are still valid and understandable units of frequency.

If I recall correctly, when it was first proposed that we use the
'continental' Hertz, the Hz was supposed to be only for electrical
units. Therefore, the electrical drive to a loudspeaker would be in Hz,
but the movement of the cone would be in c/s.

I think the reality is that many/most of us do look at "pf" and "rtty" and turn it into a real word. But we generally keep it to ourselves.

Only when someone else blurted out "puff" or "ritty" did I realize I wasn't the only one who did it. I simply wasn't the one who said it out loud.

It was interesting that the problem turned out to be so simple after some tail chasing.
I've checked the meter performance since replacing the resistor. The R-388 meter does not have an absolute

reference, rather it indicates the level above the AVC threshold. The handbook states this as being about 3 uV on all bands except No.1 where it is higher. I think this probably varies somewhat with the particular tubes in the set and also probably from band to band. On my test, made at about 4 mhz and checked at about 10 mhz, I found the threshold to be about 2.5uV

On my receiver the scale is fairly linear up to about 60db and above that is compressed but the meter will go off scale with enough input. The saturation point seems to be about 300 to 500 milivolts on bands higher than No.1. Didn't check it there.

I found that there is a rough correspondence between the audio decibel scale and S-units assuming S-9 = 50uv
0 RF = about S-4.5
Audio scale
S-7 = -1db
S-8 = -4db
S-9 = -2db
S-9+10db = 0db
S-9+20   = +2db
S-9+30   = +3db
S-9+40   = +4db

At least gives you a sort of reference since S units are not very exact anyway. Note that the audio level scale is not co-incident with the RF scale so the level differences in db don't match. The numbers are simply easier to spot than those on the RF scale plus the audio scale is uppermost for some reason.

Like I said, I will take it depending on the postage. It should fit in

Recently acquired a vintage 1927 A****er-Kent Model 33 TRF radio.
It has six identical CX301A tubes with one exception: Tube#4, which I believe to be the final tube of the TRF section (input to the two AF tubes),
has a heavy chrome cap over the top of it. This cap is supported by a couple felt pads between the cap and the top of the tube. There appears to be no provision to ground this to the chassis (and use as a shield).
Was/is there a function of this cap, or was it just a cosmetic thing ?
Did all the tubes originaly have these caps ?

PS: Why does the name "A****er" appear with stars between it ?
(Word Police: Please fix the censor pgm to allow the A-K name, there's nothing vulgar about it.)

It is to dampen microphonics caused by physical vibration.  Usually used
on the detector tube.

Does somebody know the antenna the tuner shown in:

http://www.qsl.net/i0jx/tuner.jpg

It was built by the French company CIT, but it clearly is a Collins tuner, with two vacuum variable capacitors and two fixed ones.

Any information would be appreciated, especially the Collins model number and (dream!) the schematic diagram

Thanks & 73

I also need a part for this bridge. It's the gray
binding post bushing on the upper left of the panel.
I think these same binding posts were used on most

here: http://www.radiowymsey.org/IMG_0003.JPG

The cap is approx 6 x 3 x 2 inches

Thanks,

Quick answer, I don't know. However there are clues here that could help someone with a better memory than me.

1. 5 gang variables were common in superhet receivers with two RF stages. Mostly military, and mostly aircraft.
2. Looks like the tuning drive adapter is for a remote control cable.

BC-348/224's had 5 gang variables, I believe, as did the BC-312. however those had a direct drive, 1/4" shaft from the worm drive, not a remote cable adapter.

Sorry to waste bandwidth here, but I don't know.

Probably from a SCR-269 (BC-433) or ARN-7 Radio Compass. Loop, 2 RF,
Oscillator and Mixer tuning.

These were indeed used on many GR instruments, parts should not be difficult to find but you may have to settle for another color.

The capacitor has a second gear driving a sliding rod, probably used to
move a dial pointer (see the two gears below the worm gear?).  I suspect
the radio was tuned via a motor connected via a spline to the worm drive
and the moving rod was somehow connected to the dial pointer.

If you want to search around the GR type number is 938. A couple of GR catalogues list metal top, red top, and black top post, and red and black insulators as well as a metal spacer to take the place of an insulator for grounding posts. Gray may have been a special for use on gray-face GR instruments but does not seem to be listed in the catalogue. Nor are the part numbers for the binding posts listed in either of the handbooks I have for the bridge. A black insulator would be fine here.

John,

I found a picture of a SCR-263 at
www.fidnet.com/~seanbart/SCR-263/BC-443-A_Top.jpg This is the cap but
with a forward facing cable connector for the drive cable.

Charlie.

See the pic at www.fidnet.com/~seanbart/SCR-263/BC-443-A_Top.jpg , I think the rod is there to act as a stop, there is a pin on the sliding piece that hits another pin at each end of the lead screw and inhibits rotation.

Interesting. I restored a SCR-269 system in the early 80's and vaguely remember the cap. SCR-269 Radio Compass/ADF (3 bands) and the very similar AN/ARN-7 (4 bands, same frequency range) run from 28V DC and115V 400 Hz AC and are recognizably from the same stable as the SCR-263 (and the earlier MN-26). B+ is generated by a transformer/ rectifier - 5Z4? - also 48V AC for the indicator system. The SCR-269 was good performer but had endless capacitor failures. Anyplace there was a capacitor with B+ on one side and a ground or a grid on the other was a problem.

Current equipment is a '50s AN/ARN-6, still looks similar to the earlier Bendix ADF's. Best of all, the ARN-6 uses +28V on the plates.

Could an ART-13 owner please confirm that that radio works in this way:

- PHONE mode: when the switch is in either TUNE or OPERATE, the dynamotor only runs when the microphone PTT or the CW key or the TEST switch are operated. With the switch in CALIBRATE the dynamotor runs continuously

- CW mode: whatever you do, the dynamotor runs continuously.

Thanks for your help.

Mine has the same behavior, and the technical manual says that it's the way it works so no problem.

Furthermore it seems rather logical as in A.M. mode the H.T.s are only required when the mike paddle is depressed... The dynamotor speed settle time is acceptable in this mode but try to figure out the dynamotor being turned on and off at the keying speed in CW!

Hope this helps,

Thierry

I've tried selling this Viet-Nam era electronic warfare scope
http://radioheaven.homestead.com/IP37-APA74.html
and no one is interested, so I'm going to try parting it out.
It has a bunch of tubes, I'm going to keep the square face 6 gun
CRT for my collection, for some reason I like big CRTs.

I have no idea what these are worth, battery era tubes are more
in my field of interest.

5670 (9), 5847, 5763, 5814A (6), 12AT7A/WA (3),
5751 (2), 5725/6sa6W, 5896 pencil tube.

I also have tube shields for them,
some are sliver color and some are black, for high heat?

If you're interested in any of these let me know.
I have not tested them, the piece of gear they're in is new,
it was still wrapped in the paper until this afternoon.

Thanks for information. OK for CW, though for AM it gives me a strange feeling to hear the dynamotor starting every time I push the microphone PTT. In the BC-191 / BC 375 the dynamotor instead runs continuously, either CW or AM.

I have built an AC power supply for my ART-13 and I must now adapt its control logic to that of the ART-13, which is not immediate to understand because the schematic diagram is not easy to read (so many relays ...) and the service manual describes things using a rather odd sentence structure, difficult to follow. I do not succeed to get the antenna relay energized in any way, so I fear I'll have quite a hard time in the near future to have it in working order.

You're welcome, it's always a pleasure to have an opportunity to read or to talk about this wonder.

About the behaviour of the dynamotors on the wwii US transmitters I can add that on the BC604-684 it also goes on and off depending of the ptt or tune button.

I must say that I've not powered up my T-13 for a while, about 22 years... A true shame. I've got all the components including a very strong 19" rack to build an AC P.S. in storage, waiting for the right day to come as the dynamotor seems to be a little too much an outdated item by today's comfort, noise and energy savings standards.

In fact I'm still hoping to have enough spare time someday to get a license to use this Tx. as it should be, not only to power up a dummy load.

I'll have a look in my documentation as I believe I could have some schematics showing the connections required on/between plugs to operate the Collins with a separate mains supply.

Also, I would be glad to know if you've got any help from ICP for your RF ammeter?

73,

Thierry

I have the ART-13's 1950s descendant, the Collins 618S (ARC-38). This has the same dynamotor behavior as the ART-13 - it runs continuously when in CW mode. This is quite normal; when in AM mode the dynamotor runs *only* in xmit mode. In the 618S B+ voltages for the xmit and modulator
are generated by the dynamotor, B+ (and B-) for the rest of the system is derived from the 115V 400 Hz supply. On my 618S I run the filaments from a filtered 27.5V DC supply, the dynamotor from raw DC. This is accomplished by minor rewiring of the 416W-1 power supply; it's probably easier on an ART-13.

I contacted ICP but they do not have a spare meter to sell. Anyway I restored my meter in some way. The thermocouple had blown up, so I replaced it with a 5-ohm resistor across which I put a Shottky diode which measures RF voltage and, hence, RF current. It works fine and I adjusted it for 250mA full scale, as the original meter. Clearly the scale is not the same, but it is OK until I will find a spare meter. Another uncertaintly is the resistor value, which should ideally be the same as the original thermocouple, but I do not know how much it was.

Yesterday I was able to finally get my ART-13 working. It delivers about 140 RF on 7 MHz. Everything seems to work fine including the auto-tune system. Next step will be to hook it up to a BC-348 receiver.

I am using a home-built power supply instead of the original dynamotor which is very noisy. Not difficult to build. I have a transformer connected to a voltage doubler which delivers about 1300V. Another transformer connected to a bridge rectifier delivers about 400VDC. And finally the filament transformer connected to a high-current bridge rectifier which delivers 28VDC at 9A. Plus two control relays. Connections are rather easy. The only issue is to get the connector for the ART-13 which is quite expensive (they typically sell it for about 50$).

In Italy we use the frequency of 7.190 kHz for AM, and one can find there many AM aficionados on saturdays and sundays. I normally use a BC-191 hooked up to a BC-312 receiver, and now I would like to try my ART-13 + BC-348.

John VK3XAO

Yes, looking to the schematic diagram, I see a relay that interrupts high voltage (+1250VDC) on the modulator tubes plate circuit when one runs CW. So having the dynamotor continuously running is no problem, because the modulator tubes would draw no current anyway.

When in AM instead, there would in principle be two alternatives:

- to have the dynamotor running continuosly. But they should then have a relay which removes plate voltage from the modulator tubes during receive, so as to avoid a useless power consumption from the battery. Such arrangement could cause high voltage spikes in the relay and/or modulation transformer

- to instead have the dynamotor running only during xmit

Evidently they selected the second one.

As to the power supply, I preferred to build a power supply fully replacing the dynamotor which is too noisy. Anyway feeding the dynamotor with raw (unfiltered) DC seems to me a good idea if one wants to use the dynamotor without a battery.

Understand your desire not to have dynamotor noise nearby. The 618S dynamotor is rather smooth and quiet, to me at least. When installed in Boeing 707's, the dynamotor power supply 416W-1 was replaced by a 208V 3-phase 400 Hz input power supply, the 416W-3. More reliable than 416W-1. DC input to the dynamotor is ~ 20A @ 27.5V DC from a 27.5V 750W supply - no batteries in the system.

Testing, my ART-13, I can obtain a good match on 7 MHz, 10 MHz and 14 MHz, with the antenna switch (control C) on position 11 or 12.

But when I try to operate on 3.5 MHz, I am unable to obtain a good match at any antenna switch position. I can get roughly half the RF power with a higher plate current, this indicating that match is poor. Grid current is OK.

At switch position 8 and above the matching network is a Pi; at position 7 and below it becomes a simple L.

I know that the transmitter was designed to match short (capacitive) antennas, and it may then not like the 50-ohm resistance of my 80-meter dipole. But before carrying out further investigations, I would like to hear if somebody had experience in operating the ART-13 on 80 meters.

Thanks & 73

Tony I0JX
Rome, Italy

P.S. I do not succeed to get enough grid current at 18.070 MHz that is at the very extreme of the transmitter operating band

Are you testing into a dummy load?

If you have an antenna impedance bridge you may be able to measure the effective impedance of the output stage. If the transmitter is operating normally you may need some sort of external tuner.

A search of my junkbox yielded all the parts needed to build a clone of
the Heathkit HD1250 dip meter.  I've always wanted to build one, so I
made my own Heathkit.  Thought I'd share this....

OK,so it is not a BA,,It is old enought to be one..Can someone tell me
how to remove the VFO..It  does not appear to be a simple 1-2-3 action
and I don`t like to do extra work..The Vfo knob will not drive the
pto,may be from inactivity..may need cleaning or whatever...thanks

Two points:

1. The ARRL Mobile Manual had a bunch of homebrew antenna projects, some built
   from parts and some built from military surplus bits and pieces.  Back then,
   a _lot_ of hams were running homebrew antennae.

2. There are a lot of military surplus mobile antennae available from Fair
   Radio Sales, and again that stuff was a lot more popular back in the
   fifties and sixties than purpose-built ham antennae.

You can plug 2 of the old FT-243 style crystals into an octal
socket. You will have to look in the manual for the proper
orientation.

Appreciate all the replies received, direct and via the group.
I got my license in 1960 at age of 15. Everyone has a tendency to "collect"
something..my interest in mobile antennas goes away back.
Operating HF Mobile is one of the greatest thrills I know of, including QRP!
The Magic of Radio still prevails !

Now that I'm retired, I can obtain some of these antennas and compare them
with on the air evaluation..Not quite an Antenna shootout, but my own
evaluation.

Doubt that I can sell them to Newer Hams when I'm ready to dispose of them,
so will likely donate them to a local Radio Museum where the youth can see
that many mobile antennas were not Screwdriver Antennas.

Hi,

You can also use two type HC-17/U fundamental mode crystals
in the octal socket. You should specify 32pF load capacitance
when you order them. Most crystal suppliers no longer offer
crystals in the old FT-243 holders.

The type HC-17/U holder is the same as the modern, hermetic,
HC-6/U holder, but has thicker pins to mate with the sockets
that were used with FT-243 crystals.

The crystals take the place of the VFO, whose output frequencies
were multiplied to get to the higher bands.
So if you want a crystal to operate on 14,200 , 21,300 or 28,400
you would plug in a 7,100 KHz crystal.

The manual has the chart of which crystals to use
for the desired band.

Ed Knobloch

thanks guys,
as i understand the octal tube socket is in fact the crystal holder,
you can not have thick fingers to put crystals in place hi,

I HAVE A WEBSTER BANDSPANNER MOBILE ANTENNA BUT HAVEN'T USE IT FOR
MANY YEARS.
LAST TIME I USED IT WAS ON 75 AND 40 MTRS MOBILE WITH HEATHKIT SB104A
AND HAD MANY
CONTACTS ON EAST COAST. HAVE NO IDEA WHAT WOULD BE A REASONABLE SALE
PRICE.
HAVE NO NEED FOR IT NOW AS I AM AN OLD CODGER IN BAD HEALTH AND COULD
USE THE MONEY
TO PAY FOR LAST FOUR OPERATIONS.  DON'T EXPECT TO BE HERE A LOT LONGER
AS ALL OPERATIONS
WERE ON HEART AND PAD AND NOW BLEEDING IN STOMACH FROM BLEEDING VEINS.
HAVE BEEN A HAM FOR OVER FIFTY YEARS, AND NOW HAVE MY OLD CALLSIGN
BACK THREE YEARS

This amp was built by P&H Electronics in Lafayette Indiana in 1956..It used four 1625 tubes or 837 tubes in GG...The manual says that the 1625 tubes are modified ..Doesn`t say what sort of modifications they have..Tube Manual shows same pin-out ,same socket ,same connections etc..Anyone know what the modifcations might be...They both seem to operate all OK with about the same power out..I seem to remember an article some years back about removing the socket from the tube and changing some pin connections or whatever...any help appreciated..

If I remember it correctly, the modification consisted in separating the suppressor grid from the cathode, so that the tube can be operated as a triode.

Actually within the socket there are two separate wires for the suppressor grid and the cathode, both connected to pin 6. The modification consisted in de-soldering the suppressor grid wire and moving it to a free pin (pin 2 or pin 5).

Such a modification was not possible for the 807 (the 6.3V version of the 1625), because it only has five pins in total.

Yes, the assumption is that you have very thin fingers to put the crystals
in. I found a surgeon's tool with rubber tips, that works ok. You can also
put some masking tape on the crystals to make a little handle sticking out
the tip.

Now if I could only do that so easily when getting stuck in the middle
seat on a commercial airplane flight.

Wonder if I could wrap a masking tape handle around myself so that they
could extract me from the dreaded middle seat after a 4 hour flight?!?

ok colin, see wat i can do,
there was surely a better way for swapping the crystals,
wonder why they put the tube socket so deep,
the solution with the dummy knob for covering the hole was not a bad
idea,
unfortunaty it came not with the radio,
so finding one seems to be impossible, but who nows ....

If the 807 in question has two wires going to the same pin it would be
possible to remove the base and replace it with a 6 or 7 pin base (or
even an octal base) from a dead tube and move the suppressor to its own
pin.  OR you could just connect the suppressor to one of the other grid
pins since you're going to run the tube in grounded grid anyway.  Either
way though it's no longer an 807 and should be marked as such in case
the tube ends up elsewhere.

I wonder if the 6BG6G sweep tube (or even the 6L6G) was also made in the
same way, with the suppressor having its own wire outside of the bulb?
The 6BG6G is almost an 807 in an octal base.  The only difference is
that the 807 has extra RF shielding and sometimes ceramic plate supports
lacking in the 6BG6G.  Both tubes are derived from the 6L6G.

I seem to remember only certain brands of 1625 were suitable for the mod.
Some brands had the supressor connected to the cathode inside the envelope.
I don't know if this also pertains to 807s.

All,

I'm currently considering a design for making a steampunk radio. I
just
had an idea for the VFO that I want to run by those who have a far
better grasp of the abstract mathematics of harmonics than I do.

Suppose I have a DC motor running steady at 1000 RPM. Through a
X100 set of planetary gears I create a shaft spinning at 20,000 RPM,
which is pretty much the upper limit for small drills anyway. On

the
shaft is a disk that is an etched circuit board with a star pattern,
that is,
500 conductors etched radiating from the center to the edge of the
disk.

Now I have a wiper that is laid across the edge of the disk to make or
break contact with the outside of the star pattern, with 12 Volts DC
potential on the wiper.   Assuming the shaft was conductive and made
firm contact with the center of the star pattern, should I see a 10
Mhz
square wave, suitable for say a switching mixer?

Question: How bad are the phase noise and harmonics likely to be?

Thanks in advance,

The Eternal Squire

***

20,000 rpm, so how many revs a second?
20000 rev/minute x 1/60 minutes/second = 333 rev/second
How many spokes?
333 rev/sec x   500 spokes/rev = 167000 spokes/sec

No, you would see a 167kHz square wave, with plenty of odd harmonics:
500 kHz, 833kHz, 1170kHz etc.

The harmonics speak for themselves. Mechanical rotation is hard to keep
constant.

Really bad, but the harmonics you can filter.  Phase noise is going to
be way too high for anything but CW and your frequency stability won't
be anything to write home about.  However, the system you describe was
built by Federal Electric in the 1920s, so it's at least practical.

I think Federal used the Poulsen arc converter, a
steady arc where this thing is more closely related to the

rotary arc, also used in early wireless. There were two types of rotary arcs but both operated at much lower interuption rates, typically at around 400 hz, and generated the RF energy by means of tuned tank circuits. Federal Telegraph held Poulsen patents and exploited them in series of wireless telegraph stations mostly on the West coast of the USA. The rotary arc is not to be confused with the Alexanderson alternator, a mechanical generator of low RF energy. The alternator put out fairly pure CW. The Alexanderson patents were controlled by General Electric and were one of the main reasons for the founding of RCA after WW-1, that is, to maintain wireless in the US under US control.

The Poulsen arc was widely used on board ships. The device requires an atmosphere of hydrogen for the arc and has a supply of alcohol to provide the gas by means of disociation due to the arc. That gave the radio operator a supply of drinkable alcohol which made the "sparks" popular.

Instead of mechanical contacts I would try an optical sensor but this
may not be very Steampunk. I have a friend who built a small steam
engine, for demo purposes he would run it on compressed air at 40K
RPM.

The tuned tank circuit isn't generating the RF energy, it's just selecting the energy you want.

Interrupt an arc and you get lots of harmonics tied to the interruption rate, going way up. Run it through an RC filter and you can select the particular harmonic you want to transmit, shunting the others to ground (and throwing most of your power away in the process).

The Poulsen used a continuous arc which generated white noise.... you filter that noise out and you get a signal that is narrowband... and the narrower you filter it, the more power you lose. It's a lot less efficient than the rotary, even.

The Alexanderson puts out a very nice note.... the problem with it is keeping
it on frequency, not phase noise. Oh, also keeping it from flying apart and
exploding is another issue. It's a far higher tech device and much more
difficult to make... and also not so effective at higher frequencies.

The number of poles is part of the issue, but you'd think with modern machining technology you could make a big rotor with maybe a thousand poles. Problem is that if you do this, the capacitance kills you.

One possibility to run an Alexanderson alternator would be to run it

into a nonlinear device and then select one harmonic out. Again, it's
very inefficient....

Very elegant!   And no, I believe that photo etching a thousand poles
or more on
a copper-clad should be very possible with laser printing of the
master.  The manufacturing
technology wouldn't be steampunk even if the results are :)

By the way 167 thousand cycles (167 kilohertz). Is right in the
European 'Long Wave' broadcasting band! For example BBC is on 198
kilohertz just slightly longer than 1500 metres wavelength! (1515
metres).
Not sure what is the point of electromechanical frequency generation?

Not sure what is the point of electromechanical frequency generation?

More like the rotary arc. The Alexanderson was a high-frequency alternator producing pretty pure CW. Several very large ones were built (200KW) operating at long wavelengths, perhaps up to a couple of hundred Khz. Some remained in service for decades.

Rotary arcs were used to generate modulated waves, so called MCW so that the detected code could be read without a modulator at the receiver. Typically they had interruption rates on the order of 500 hz. They were often called "rock crushers" because of the terrific mechanical noise they made.

Hank,

http://bama.edebris.com/manuals/hallicra/sx28/

Page 14 has a voltage chart that includes some AVC voltages. But you may already have this document.

Hello Everyone,

I'm looking for old Tektronix equipment in the lower-mainland (British Columbia, Canada) - for hobbyist purposes. Anything - including 300-series, 400-series and 500-series oscilloscopes. As well as any accessories.

Since this is for a hobby of mine, I don't have a huge amount of money to spend, but will certainly try to be fair.

I have a passion for the older test equipment, especially Tektronix - I'm also interested in old HP test equipment if you've got any as well.

Let me know what you have and I'll come take it away.

Appreciate your time -

Regards,

Chris

Hi,

I hope somebody could help me.

Recently acquired RCA AR88D. Resistor R10 (1000 ohms) in the RF stage has blown. Replaced with new resistor and that also fried. Where should I be looking?

Many thanks in advance,
Tim

I wonder if anyone can identify the balun I bought at a sale
recently which I think is probably American. It is housed in a grey
painted metal box approx 3 in wide x 2.5 in high x 2.5 in deep with
a mounting bracket spot welded to the base. It has an Amphenol SO239
socket and four ceramic terminals which can be connected to
provide matching to 75 or 300 ohms. Markings on the side are CMC
173-160 , CMC/CGP 170-800 and FL 241-A.

I have put up two pics at
www.radiowymsey.org/rf1.jpg and
www.radiowymsey.org/rf2.jpg

TIA,

Charlie.

Does any one know a site listing the quotation of boatanchors?

I particular I am interested in the SX-28 value. The last one was sold on e-bay at $202.50, and the buy-it-now price of another SX-28 is $225. I am not sure if such prices are respresentative of real market value.

Thanks & 73

I have one of these that I horsetraded for a year or so ago, and it had
837 type tubes in it instead of 1625's. I think I read somewhere that
P&H used 837's in the later models. I have never had it on the air but
it looks nice and lights up.

Hi Richard,

Finally had the time today to check C-63 and yes, it had shorted. It
was replaced and the AR88D burst back into life. Many thanks for
helping me out - it's really appreciated!

All the best,
Tim

Hi, I'm looking for some historical information.
The Canadian Air & Space Museum, Toronto, Canada is restoring the1944 Avro 683 Lancaster X heavy bomber number FM104 for static display, see http://casmuseum.org/avro_683_lancaster_x.shtml.
I am restoring and recommissioning the radios for this A/C. They are all Bendix, viz: Receiver RA 10D, Remote Tuning Unit and Transmitter TA-12, also Interphone, DF, etc, see http://www.radiomilitari.com/ra10d.html for a couple of these units.
We are planning to demonstrate some of these avionics at "Wings & Wheels" on May 29 and 30, 2010, see http://www.wingsandwheelsfestival.com/home.html.
For this demo I'm preparing labels for each item, plus an overall introduction to the radio equipment.
My understanding was that WW2 British Lancs used the 1155/1154 gear while most Canadian Lancs used the Bendix gear. However, in the Hammond Radio Museum, Guelph, Ontario, Canada, http://www.hammondmuseumofradio.org/
there is a photo of a Canadian Air Force radio technician sitting at a

WW2 Lancaster radio table equipped with R1155/T1154 gear.
Does anyone know which Canadian Lancasters used the Bendix RA 10D
receiver/TA12 transmitter and which used the UK manufactured (EKCO,
Marconi, Plessey or EMI) R1155 receiver/T1154 transmitter?
I think all RAF Lancasters used the R1155/T1154 gear, see Duxford
radio society page http://www.duxfordradiosociety.org/equiphist/r1155/t1154-r1155-v1mod3.pdf.
But, from the Hammond Radio Museum photo, it appears that some
Canadian Aircraft did too. I wonder how many.
Thanks for all replies,
Cheers,
Roger

I don't know about Canadian aircraft production. But I know that on the

US manufacturing lines they were churning aircraft out as quickly as possible,
all three shifts going. When a particular device was unavailable, there would
be quick re-engineering to put something else in. So a lot of the American
aircraft had some pretty dramatic changes over their production run and
accurate records weren't really kept. So a lot of it becomes a matter of
looking for the particular configuration for a particular aircraft.

And then after the war all that ARC-5 junk was selling for pennies on the
dollar.

Looking if anyone has a SB-303 that they are parting out....I need a front panel in good condition. No knobs or meter. Just the front panel itself. The paint is flaking off of mine and I am wanting to restore the unit......

Oh, the "snobbery"! "ARC-5 junk"? In the "day", these honeys were the
hottest "junk" around!
Hot receivers, great "Q5ers", VFOs, 100 watt transmitters (with a bit of
"youp-di-youp-youp admittedly)
"phasing" SSB exciters and finals, cool sounding dynamotors....... Junk?
Come on, Dad, you're joking?

Does anyone know what that almost "pearloid" finish is, found on an
NC-183D, or the lighter shade on an NC-57B? Its not just a color, it
seems to be a very lightly reflective finish. Its not a hammertone, it
is a solid color. But it seems to have a depth thats beyond just a
simple paint.
Any help would be appreciated!

Hammerite brand will get you pretty close. Although the name is similarly suggestive its not quite a hammertone finish.

I got some at Eastwood.com several years back.

Mfr p/n 41105 Hammered Silver Gray. UPC # 51652-41105. Masterchem.com makes it.

As with most of these type things there's a bit of a learning curve in using it to get the desired results.

Its as close as I've been able to come and I think its worth a try for you.

THANK YOU for that information. I regularly restore
Nationals and

Interesting, I looked closely at a National
loudspeaker cabinet, the finish appears to be very slightly
"dappled" with spots that are very slightly darker than the
overall gray. I never really noticed this before although I
realized that there was something "different" about the
National paint.

Have you tried Ebay? Some things get bid up to insane level but if you place limit on your bid, something else will come along sooner or later that you may pick up really cheap. Try Craigslist too. You might get lucky.

I live in a neighborhood where there is horrendous noise to the point where I can't receive weak signals. My setup has an RME DB-20 R.F. preamp feeding the Hammarlund. The antenna is just a wire I ran through the trees away from any power lines. Some of the noise was coming from early generation CFL's, some from my SCR touch lamp which makes noise even while off. Even cell phone battery chargers and AA NiMH chargers seem to have switching supplies in them and they probably all came from China. I turned off my plug strip feeding this mess and the noise went down but was still there. I turned off everything in the house and still had noise.

When I put my scope on it the noise was synced to a major peak at both the 90 degree and 270 degree points and did look like scr noise.

Now the hard part.

Can I put a noise blanker between the preamp and the radio?

I know that Hammarlund had a noise blanked circuit but these are very hard to find and usually a lot of $$$$.

I am/was an electronics engineer for over 30 years but I find myself at a loss as to what I should build or buy.

A noise blanker on the antenna input to the preamp seems like a good place to put a blanker but the signal off the 25 foot 'long' wire might not be enough to work with. My thinking is that it would be good to intercept the noise before it even gets into thee tuned circuits and causes ringing or some other side effect.

Ideas please.
Thanks,
Bill Baka

Noise blankers are usually inserted in the IF chain and work at a single frequency, and on signals of relatively high amplitude. Trying to get something to work across the complete range of frequencies you're listening to might be a real engineering trick.

Have you considered a noise cancelling receiver like the MFJ 1025/1026?

They use a separate noise antenna (the 1026 comes with one) and combine the signal from it and your regular receiving antenna and then apply phase shifts to either enhance or cancel signals that are received by both antennas. The method is effective in theory, but I have no idea how well the theory is implemented with these products.

Sounds like it might be worth a try, but I don't have any $$$ to buy
anything right now. I'm on disability so my income does not go too far.

Welcome to the New Era. Everything has a switching supply in it. None
of them meet FCC Part 15 specs. Nobody at the FCC gives a damn. Write
your congressman and complain about the enormous arrays of CFLs, touch
lamps, and TV sets for sale at Wal-Mart which are patently illegal.

>Now the hard part.

No, and I think the preamp is probably a lot of your issue, that broadband
noise is saturating it. You might want to consider a more tightly tuned
preamp, possibly one with a front end that has outrageous dynamic range and
low noise (like, say a nuvistor or even a 6X8).

>I know that Hammarlund had a noise blanked circuit but these are very

These actually go into the IF strip, and to be honest they aren't really
very effective against the kind of noise problem you are encountering.
They are great for the occasional impulse from things like arcing power
lines or ignition noise, but the whines and drones from switching supplies
aren't so easy to deal with.

What's happening is that those side effects are happening inside your
preamp.  Why do you need the preamp at all?  The receiver sensitivity
should be okay by itself, and the dynamic range of the receiver front end
is better than any solid state preamp.

Tell me about it. Damn near everything that comes out of Walmart is
Chinese and if I buy anything it seems to fail just after any hope of
warranty. The noise seems to come from anything Chinese so I try not to
buy that stuff, but in many cases China is the only source.

It does have switch so I can bypass the preamp and just go through the
radio. The preamp only gets overloaded by an AM station here on 1,600
KHz at 5,000 or 50,000 watts, even though the station is a good 5 miles
from me. If I hit that with the preamp on, yes it will overload, but
going straight to the Hammarlund still gives excellent tuning so in
order to get

The preamp really is only useful above 20 MHz, so it isn't even used
most of the time. The Hammarlund has great sensitivity below 20 MHz but
can use the boost above that. The only thing I have been able to receive
up there is CB chatter, so that is probably not worth it.
With my scope synced to 60 Hz I can see two big spikes and lots of
little ones that take a while to settle down.

What sort of antenna are you using? You might be able to configure
something, although I'm not exactly sure what, that can provide more
directivity and maybe escape from some of the junk noise.

Don't just write it off because of the all the Chinese crap thats out
there. A problem crept up here once, right about Christmastime, where I

got a steady rhythmic buzz a couple of times per second. Figured it was a neighbors Christmas lights or something. Switched off all my breakers and it persisted. Could hear it several hundred feet away from my house on a portable radio. It was everywhere, impossible to null or peak.

But it persisted for months AFTER Christmas. Then a main breaker to my house (in the panel out front with the meter) crapped out and had to be replaced. Guess what? No more noise!

So there I was putting up with the noise and blaming neighbors and Red China and the problem was something so simple - just difficult to localize.

Just food for thought.

Good luck,

Bill M

I can vouch for the MFJ noise cancelling antenna. However, you have to keep re-adjusting it as you change frequency. Not by much, but it requires re-tweaking. It makes the noise

practically dissapear, without the artifacts of a noise limiter.
Perhaps you can find one on ebay,
Or appeal to a ham club or two for a loaner or a donation.

I have a sort of long wire, 25 feet, and the other side is grounded to a
chain link fence. There is not enough room to put up much else unless I
run a wire to the house behind me. Yup, two rental houses on one lot.
My stepdaughter lives in the back and I don't even know if she could

figure out the concept of radio DX noise. She is a cable TV addict and not at all inclined to radio. I do have a radio direction finder that I can run with a solar cell I picked up, so I can walk it around in the sun and try to find the major noise source that way. When I scoped it, it looked like a lot of SCR's triggering at various points so I kind of figure it may be SCR light dimmers.
>
> Don't just write it off because of the all the Chinese crap thats out there. A problem crept up here once, right about Christmastime, where I got a steady rhythmic buzz a couple of times per second. Figured it was a neighbors Christmas lights or something. Switched off all my breakers and it persisted. Could hear it several hundred feet away from my house on a portable radio. It was everywhere, impossible to null or peak.
>
> But it persisted for months AFTER Christmas. Then a main breaker to my house (in the panel out front with the meter) crapped out and had to be replaced. Guess what? No more noise!

Nah, my breakers are good. I have a touch lamp with an SCR in it (Chinese, of course) and it makes noise even when turned off. Louder when it is on. It does seem to be from other houses.

I think I will get my RDF and go hunting tomorrow.

One of my friends refers to MFJ as Mighty Fine Junk. How good is it?

yes, with puny antennas and rental houses and chain link fences and
stepdaughters who are "cable tv addicts" to blame you really must attack
some cogent RFI initiatives from your part.  That's what I was alluding
to before.

Yeah, but I have the 'longish' wire at the farthest point from any
electricity lines as is possible. If I run it back to her place then it
will be parallel to her power lines, so it might be worse. I just hope I
can find a bad connection on a power line so I can get the local
electric company to fix it. I might get blown off on that though.

National used so many finishes... The NC-57 and the NC-183 and NC-173
seem to have a very light carmel pearloid tone, while the 183D has a
dark grey with the same deep pearl effect. The SW-54 is grey hammered.
My NC-240D has a simple grey wrinkle finish, but this may be a re-do.

Don't blame the Chinese. The Chinese make cheap crap because Americans demand cheap crap. If Americans wanted good products, the Chinese would make good products. But the American importers are constantly after the Chinese factories to cut costs, not to improve quality, and so this is what you get.

We're not talking about catastrophic overload, we're only talking about a little nonlinearity. It doesn't take much.

You have two problems:

1. Noise that is off-channel, maybe even out of band, which either winds up being detected due to poor selectivity, poor shielding, or because something in the front end or early IF (or in your case the preamp) is mixing multiple noise sources together to form a beat product on your channel.

2. Noise that is actually on-channel, on the exact frequency you are on.

The first one can be remedied by eliminating the preamp, making sure the receiver front end is clean (ie. the first RF stage is perfectly linear) and possibly adding a preselector.

The second one cannot be remedied. The noise blanker is one thing people have used; it drops the whole signal out when the signal reaches a limiting level and it good only for impulse noise that is stronger than the signal.

One of the DSP boxes like JPS sells can help hide on-channel noise, sort of.

The speaker I have is the one for the NC-173 so the
paint should be the same. All the NC-240-D's I've seen had
wrinkle gray paint so I suspect yours is original.

I have three un-issued   air transportable radio stations , (Bendix)
new in case, never unwrapped from original packing. Complete except one
case is missing field phones.  Please advise any interest.

Everyone is giving you some excellent advice that is beyond my ability.
But having been a ham for over 50 yrs I have learned that a lot of the
noise generated locally is from two places, power lines, and believe it
or not , the biggest one is door-bell transformers in attics.
Power line problems are the easy for the most part and usually within
one mile of your qth shack.
Take a small am portable radio and a large hand held hammer and start walking
around the neighborhood. Tune off of a local station so you can hear better.
HIt each pole that you come too with the hammer, any change heard indicates
something is amiss. I have located bad ground connections in the guy wires
from the pole at so many, I can not recall the number.
If you find a pole with bad noise, don't do anything yourself. Call the local
power company,(sometimes it takes several calls until they start helping),
let them listen to the noise in your rcvr and they show them what you have
found. All power companies are suppose to have equipment that will be a
great deal better than your am radio.
In either event, you will need the power company to help you!!!!!!

Door bell transformers are the worse. They are continually connect to the power
supply 120 line. Most of the time in an attic, and don't be shocked to find that

they are under the insulation up there. They are especially a fire hazard to the
home owner, so most folks will be happy to know about them.
The only way that you can surely go down to the right house is with the power
company man. The am radio buzz and the equipment they have should put
you in a nearby homeplace. The power meter must be removed to pin it down.
If the meter is removed and the interference stops and upon re-insertion starts
again, you are at one source.
Let the power company do the talking and get permission to check the fuses boxes
first to see if it can be narrowed down to something else. If this shows up when
the fuse is open and the door bell button is pushed and nothing happens , well
you have one.

I found so many, I brought me several and asked the power man to install it
up on the roof joints. Air can the circulate and relieve the heat issue.
Everyone done this way has never gone bad again.
Hope this helps some.

This is bad advice! I have been a power line interference technician for over 30 years, and I can tell you the last thing you should be doing is hitting poles. We don't even hit our own poles.

Do NOT hit a pole with a hammer. There can be something broken and/or ready to fall, and one good smack with a hammer could cause injury to you, damage to the overhead equipment, or an outage affecting one to several hundred customers. Why do I say this? I have seen it happen.

We had a customer (a ham radio operator) recently who was becoming very impatient with the responce from our company. He started his own hunting with a hammer. He was then sent a letter from our company advisng him that any damage or outages caused by him would result in a hefty bill being sent to him.

Some power companies (ours included) will prosecute you if they catch you hitting their poles. You have no authority to hit property that does not belong to you, just like you do not have authority to hit your neighbor's dog because it barks too much or your neighbor's motorcycle because it annoys you. That pole is private property!

Call and report any possible noise problems to your power company. Keep after them! They are required to respond and repair. If they do not, notify the FCC. In the past year or so, the FCC has been coming down hard on power companies (ours included) that have failed to respond to reported problems.

Really? I try to search for American products and pay a little more for
better quality, but so many companies have been killed off it is
sometimes impossible to buy American. People seem to have the attitude
"It won't cost me MY job" until it does. I bought a Kodak digital camera
hoping it would be at least 'non-Chinese' but when I got it out of the
box, sure enough, Made in China. Too bad not enough people can put cause
and effect together. I used to gripe about 'Made in Japan' 30 years ago,
but now even Japanese companies are farming things out to China.

What happens is the channel is so strong the preamp gets mucked up. The
Hammarlund can still tune 1590 and it seems to be immune to a strong
station at 1600.

Sorry, none of the above. I have my scope on the speaker leads and the
waveform indicates power line noise being fed back by SCR controlled
devices, and/or switching power supplies. Since my scope is vintage 1989
I can't freeze just one cycle to analyze. I paid over $2,200 for the
scope, brand new, for a project I was working on at the time. The
waveform looks like an SCR spike and then a gradual decay. That is the
best I can describe it for now. Nobody here has the doorbell problem
since the houses are old for about two blocks around me. I don't know if
it is one house, or many.
Detective work is needed.

I have some old Amateur Radio Equipment I'm trying to decide whether to sell
, restore, or keep.

The stuff in question is a Johnson Viking Ranger Transmitter, the 160-10 M version, including a Johnson TR switch, and a Hallicrafters SC-77A Receiver.

I don't have a variac, so I have not fired any of them up, and I assume all will need new resistors and caps.

They're in reasonable cosmetic condition, but show signs of wear, and have been sitting on the shelf for 10 years at least.

I'm looking for some advice on whether to restore them, and if I do where I can find electrolytics to replace existing ones.

If I decide I don't have the time, what would be a fair price to offer them for? and do you recommend any particular venue?

I'm on Vancouver Island in British Columbia Canada.

** I'll give it a go.

In a class C stage, the grid is overdriven with RF voltage so the output tube is biased either fully conducting or off - as a result, the plate voltage stays fairly low whenever the tube is conducting, which is less than 50 % of each RF cycle.

However, the actual current flow through the tube depends on the ratio of the external circuit impedance (ie a tuned load) to the B+ voltage. Since the tuned load does not vary in impedance, the B+ voltage controls how much RF current flow there is.

IOW, the output voltage from a well designed class C stage follows the B+ voltage linearly over a wide range cos to a large degree, the plate voltage / plate current characteristics of the tube have been rendered irrelevant.

She is a cable TV addict and not at all inclined to radio. I do have a radio direction finder that I can run with a solar cell I picked up, so I can walk it around in the sun and try to find the major noise source that way. When I scoped it, it looked like a lot of SCR's triggering at various points so I kind of figure it may be SCR light dimmers.

To add to what Scott Dorsey said, the chain link fence may be a problem in itself. The zinc galvanizing protects the steel below from rusting, but it provides a nonlinear junction with any other metals touching it, especially copper. Your radio needs a good ground with the shortest ground lead possible. Get a good copper-clad ground rod at the home improvement store. Locate it below the window closest the radio and run a short, heavy gauge wire from it to the radio. Your radio should also be grounded to the power line ground for safety.

The preamp must be very linear and have an exceptionally high dynamic range to not cause problems. If it does not, RF interference at one frequency will mix with all other signals to produce a cacophony of noise. Your receiver should be more than sensitive enough on the lower bands to not need a preamp. If you must use it on the higher bands, consider using a high-pass filter ahead of the preamp. It will attenuate the lower frequencies (where the noise is the strongest) yet allow the higher frequencies to pass with little to no attenuation.

The Timewave (formerly JPS) ANC-4 and the MFJ 1026 noise cancellers work quite well if you have a single noise source or if one noise source dominates. With multiple sources, they do not work nearly as well. For a homebrew version, see the article by W7XC in the July, 1994 QST. Note that there are several subsequent corrections and additions to this article (9/1994, 1/1995, 9/1996).

Be persistent with the power company but do not get your hopes up. I once called the power company and they sent a crew out. They listened with their truck two-way radio and said they could not hear any noise. Of course, the truck radio was FM! :-(

Good advice but this house is old and does not have a third wire ground
line. There is one at the junction box, but only two lead wire feeding
the house. It may be time to sink a ground rod under my window.

I try to DX on anything from 540KHz to 31 MHZ, so it is a mixed bag. The noise waveform on the scope is the same with and without the preamp in the loop. If it is power line I could always hook a scope probe to the high (hot) side of the 110 VAC and take a look. I can easily build a simple filter to take out the 60 Hz power line and just look for spikes.

I'm thinking that one of these or something I design would be synced to the power line and just take out a piece at a time. A one shot for the delay to the biggest noise pulse (variable by me) and another one shot with variable width to cover the width of the noise pulse. A double section one shot and a digital switch like a DG411 could take out the worst pulse. Depending on my ambition I could make another few for the next biggest pulses, but at some point all the chopping of the signal might make the actual signal un-listenable.

The only thing I have ever gotten out of the power company was an extra transformer due to overload from one transformer feeding about ten houses, all with A/C going. They finally gave in and put in another so that only 5 houses per transformer was the end game. I tried the noise thing a while back and they just asked if I had power, and I said yes, then they said 'NO'. With so few of us non-internet addicts around these days they could care less about radio reception.
About ten years ago I located a noisy pole and told them but they did nothing until it arced over and burned off the top of the pole. Only then did they respond, and it was way more expensive than fixing it in the first place would have been.

Bob,
It really depends on what you'd like to do. If you think you'd
like to get them going and use as a vintage station, its certainly
worth the time and effort to fix them up. personally I get a big
kick out of doing this. All the time I hear folks saying they wish
they had kept their old rigs. Plenty of help if you decide to
restore. As for value if you decide to sell, check out the
forums at QRZ.com or even fleabay.

It would be good to find a manual for this unit. I have found some
info about the company on the web. It looks to be in fine shape and I
am sure it would perform as intended if I could find some
instructions. Tom's site isn't accepting email right now so I assume
patience will be the order of the day. Thanks for reading this, 73

I happened to watch Operation Petticoat a few days ago, with Cary Grant. Early in the movie, in the background of Grant's submarine was a Hallicrafters SX-43 and a Hallicrafters SX-17,   Later, there was a supply "raid" in a warehouse by Tony Curtis. Although the camera scanned quickly, it looked like a BC-610 on a pallet.

All,
Is it possible to help old cloth-covered power cords keep their
flexiblity? Is there anything that can be applied to rejuvenate the
cotton covering to prevent fraying?

I can only add a source for new, replacement cloth covered cord:

There are others.

Mark,

Dry rot and the effects of time and environment can take their toll without any way of
turning back. However, my wife whose college degree is in home economics, suggests two
products usually carried at fabric stores (Jo-Ann, Hancock etc). She also says fraying and
wear of cloth are two different problems in that fraying generally happens on the edge of
cloth. Her suggestion is to get something called "spray sizing" and try applying it to the cloth wire to
preserve or revitalize the fibers. (Obviously disconnect power...sigh...I feel stupid having to
say that because I know everyone knows better but I am a victim of
"contemporary correctness" I guess).
To retard or stop fraying get a product called "Fraychek." Also sold at fabric stores.
Good luck.

My $0.02 to add to Mark's comments is that the cloth outer serving as
well as the cotton woven over each conductor is usually covering a
rubber insulation on the copper wires. The rubber is intended to
provide a continuous seal and insulating spacing between the copper
and cotton, and since the rubber is usually well perished and
crumbling by now, it no longer is able to do it's intended job. IMHO,
it is folly to use perished cloth covered cord where a wrong flex can
easily cause strands of copper to push through the cotton and contact
each other or an external conductor [such as the user] with attendent
risk of fire, or, should a liquid be spilled on the fabric it could
easly come in contact with the copper condictors through the cracking
of the ancient rubber, again posing a shock and/or fire risk.
Personally, I always replace all the primary wiring with new,
approved, wire and add a fuse on transformer sets.

I have actually not seen the cloth coverings degrade over the years other
than from mechanical abrasion.  You can try washing them in Woolite (no joke!)
to get them nice and clean, and then just treating them carefully.

Abrasion will kill them very quickly, and once they start to fray they will
just get worse and worse.  A little clear lacquer on damaged parts can keep
the damage from spreading.

A lot of those cords were made with natural rubber insulation and then an
outer cloth jacket.  The cloth usually outlives the internal insulation
which becomes hard and crumbly.  When this happens, the cord MUST be replaced.

Hi, Gang

I have a late model HP 200CD, and was somewhat frustrated that all the manuals I found on-line were of the earlier, octal-tube, version.

Another HP enthusiast acquired an updated manual, which includes info on all the previous versions of the HP 200CD. He scanned it, sent me a pdf copy and is kindly making it available for posting.

Anyway, I have it available for download here:

If the cord is in a condition that causes you to ask this question, then it must be replaced.   Safety and reliability are always the number one goal of any radio work. Generally, all cords should be replaced, especially those that are that old.   Cloth-covered reproduction power cord is available.

This is sort of a last gasp since this is not really boatanchor stuff. I recently aquired a General RAdio 1650-A Impedance Bridge. Its missing the battery case cover. I wonder if anyone out there has one. I think the same cover was used on a couple of other GR instruments. It looks something like the bottom of a flashlight case. I can make something to fit but would like an original if I can find one.

Posting here is a very long chance but you never know if you don't ask.

I wonder whether any one would be available to precisely measure the DC resistance of the RF thermocouple meter (5A f.s.) of the ART-13 transmitter? I reckon it should be in the range of 4 ohm. The only nuisance is that, to measure resistance, one of the two leads must be disconnected as the resistance of the circuit connected to the meter is very low.

Thanks in advance.

Aren't we being a little melodramatic? Cloth covering that is worn or discolored
does not always indicate a break down of the inner insulation. Roll back the
cloth a little and take a look. If the rubber is defective it will be evident by
flexing it. Let's not always fall on the sword and over-analyze.

I will maintain that any electrical cord on anything, that is as old as we're talking about here, should be replaced.   We "shotgun" capacitors. Same thing - part of a restoration.

Of course if you're just talking about a cosmetic restoration (in a museum or on a shelf, never to be plugged in) then of course that's a different story.

I've been hitting a wall with this restoration. I recapped and completed a full alignment, and while it performs beautifully from broadcast band to 12 mhz (bands C, D and E), it is quite deaf on bands A and B (basically 12-mhz up). I didn't realize it during alignment because I had been feeding a robust RF generator signal and it was aligning quite nicely on those upper bands. But once I hooked up an antenna, I noticed that nothing but the strongest stations come through on bands A and B, 12 mhz and above. I traced the antenna coil section very carefully and checked all three sections for open coils, open bandswitch contacts and cold joints. I can inject an antenna signal at the bandswitch wafer in the mixer section and the sensitivity comes back. It seems the signal is getting held up at the antenna coil section only on bands A and B, but for the life of me, I can't find the issue, which makes me think I'm missing something. Any suggestions would be greatly appreciated!

Some of MFJ's products are indeed questionable (like their RTTY
reader)
but the noise cancelling antenna actually works as advertised. It is
very
tweak intensive, however, and precludes casual band surfing, as the
phase
relationship between the noise and signal antennas changes as you
change frequency.

Sounds almost like work. The noise is worst at the lower frequencies but
still wreaks havoc with me even getting WWV at 10 MHz. There is one
permanent spike at the peaks of the power line, so it is something that
is being rectified, and the rest just seem random in nature. I thought
it might have been SCR noise but it doesn't follow any kind of logical
pattern. The Hammarlund's noise limiter chops the main spike but thinks
the rest is a legitimate signal.

This can be just about anything, including SCRs, switching supplies, and arcing.

All you can do, once you have established that it isn't your house, is to get a handheld AM radio and use the loopstick to try and DF it. The problem is that the junk gets into power lines and then radiates from there, so it can seem to be coming from everywhere at times.

It's amazing how much trash one touch lamp can put out.

Can anyone please explain the difference(s) if any, between
the two Heathkit "Sixer" models HW-29 and HW-29A?

Well,
I do have a marine RDF, but I can't find it under my piles of stuff,
radios, car parts, more 'stuff'.
When I find it I will be out looking around.
